

Backward-then-forward planning in the cerebrum

From maze runs to hierarchical map, and back again

Edward Hedgecock
Department of Biology
Johns Hopkins University

11 May 2022

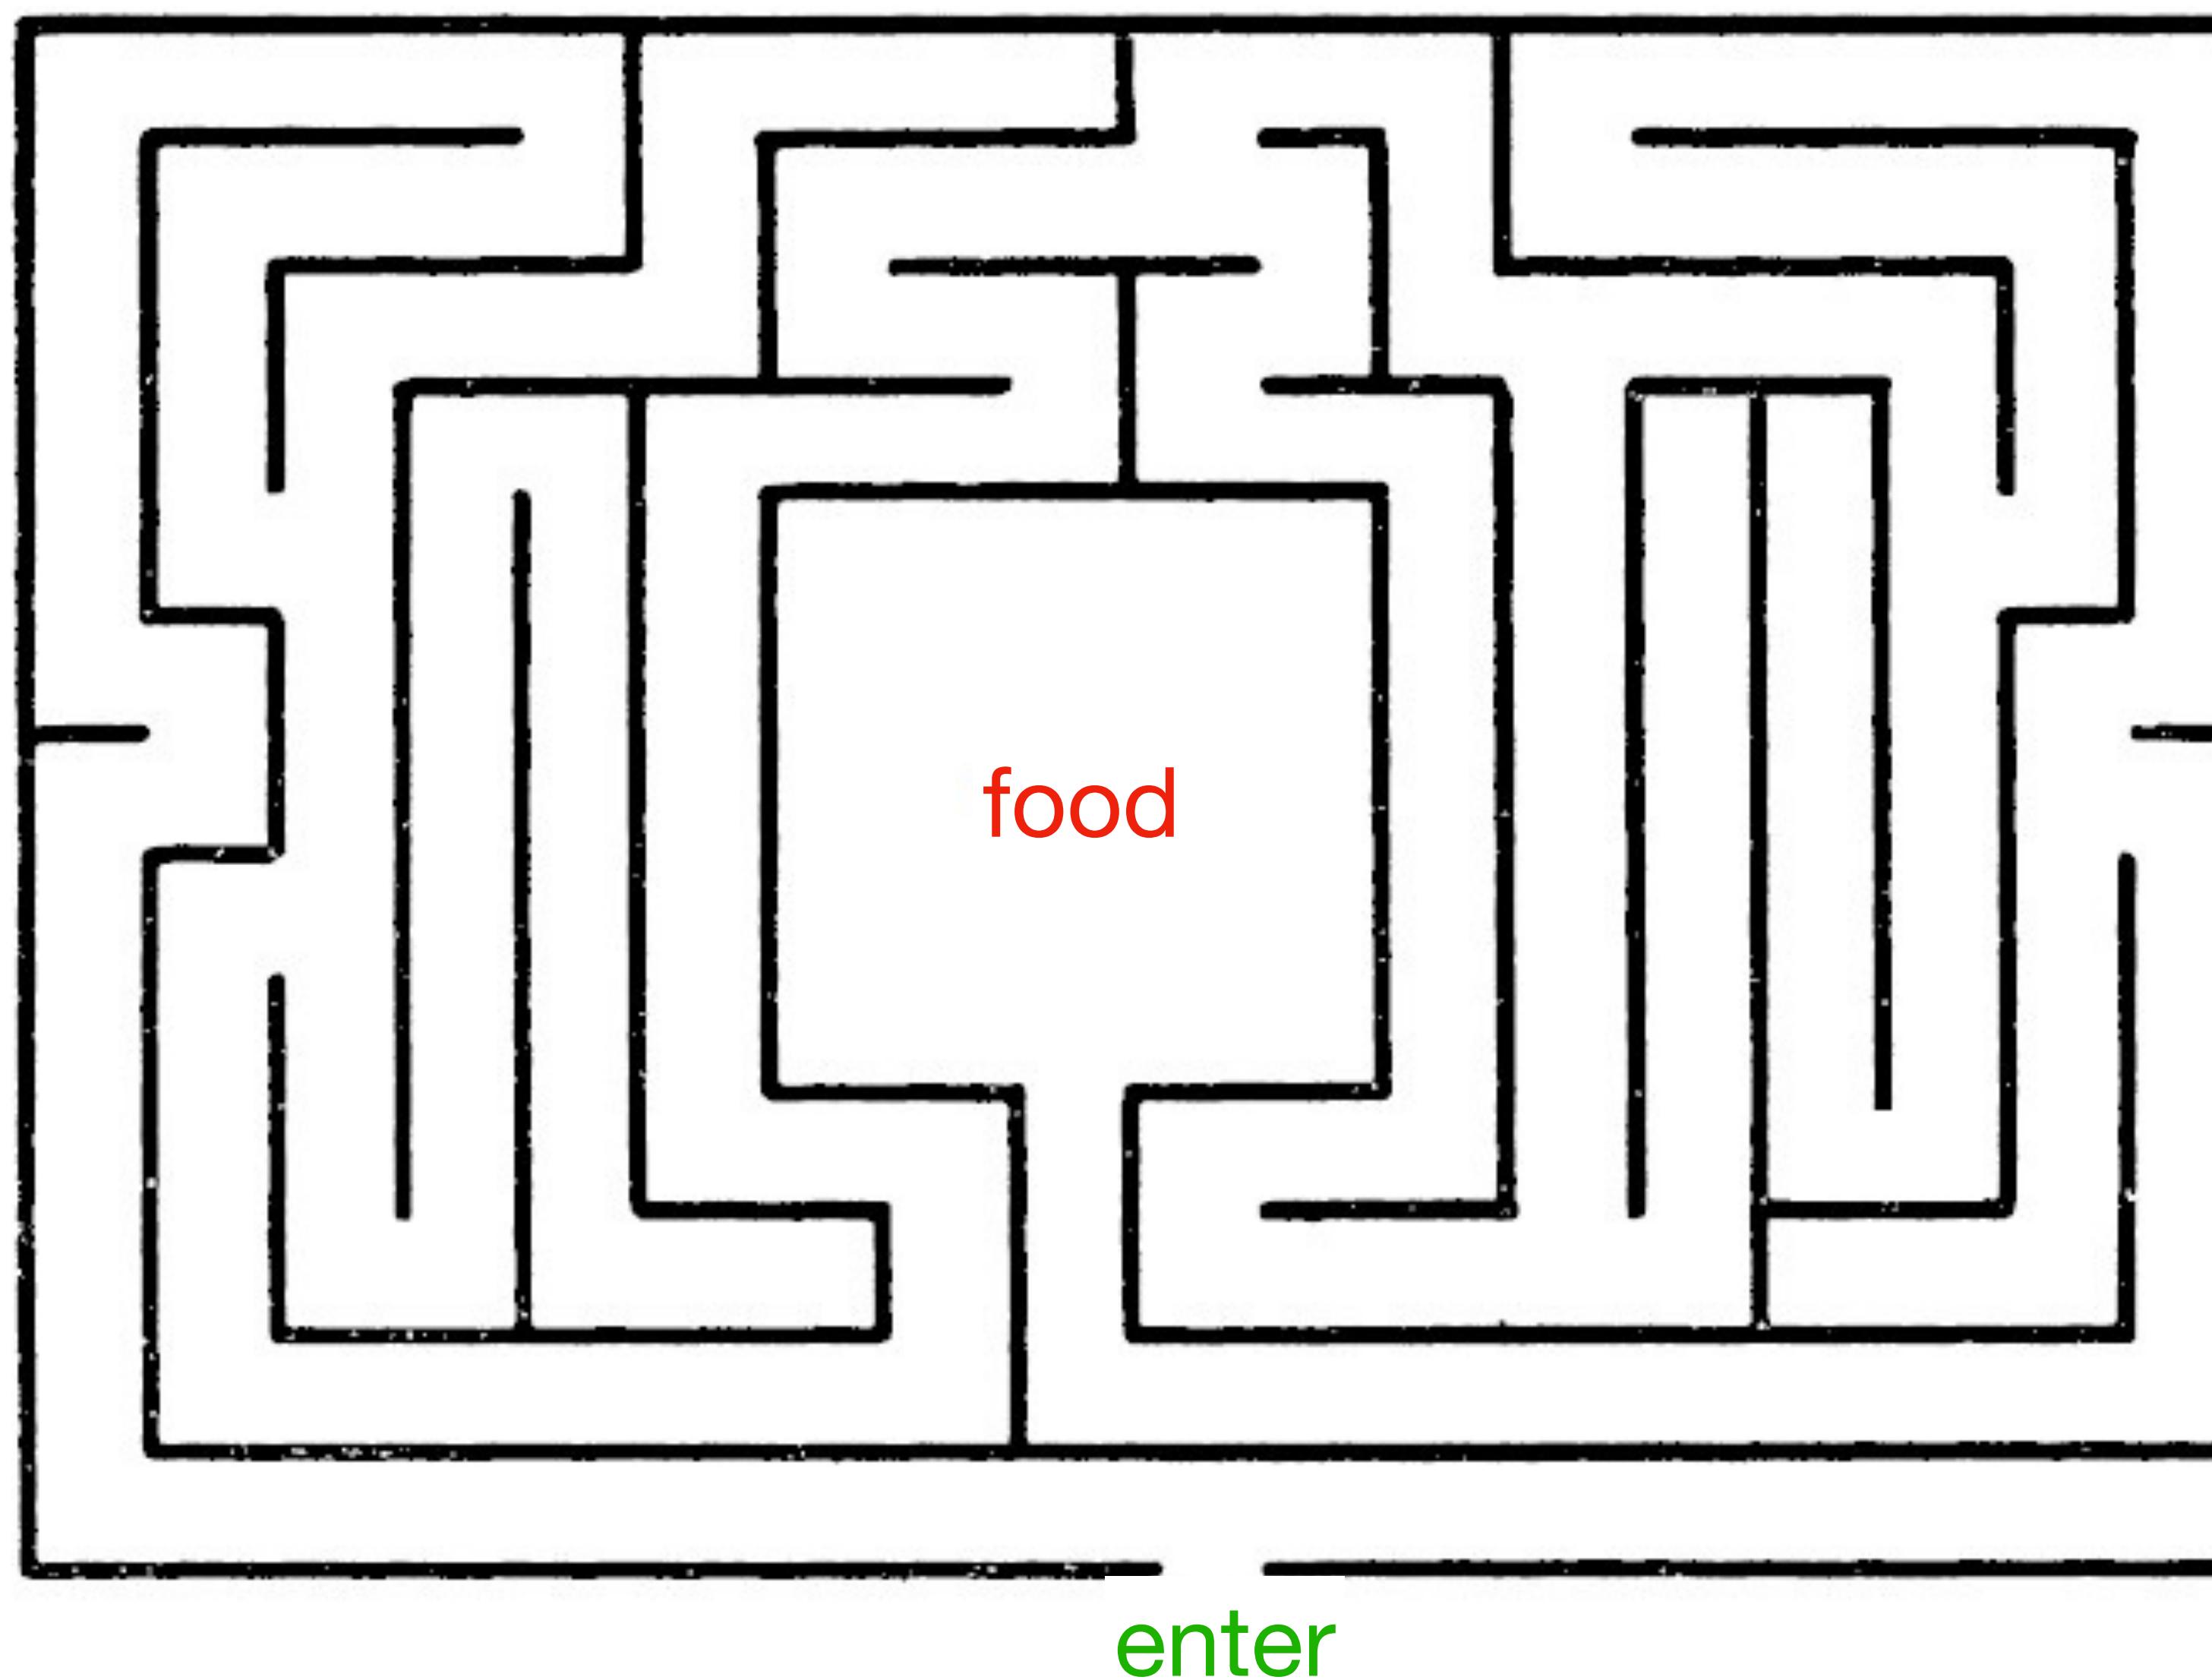

Is there a fundamental problem of motivated behavior?

Duality of explore & exploit

EXPLORE	prospect novel deposits	curiosity novel causes	discover novel places	map novel maze
EXPLOIT	mine familiar deposits	habit familiar effects	revisit familiar places	navigate map & maze

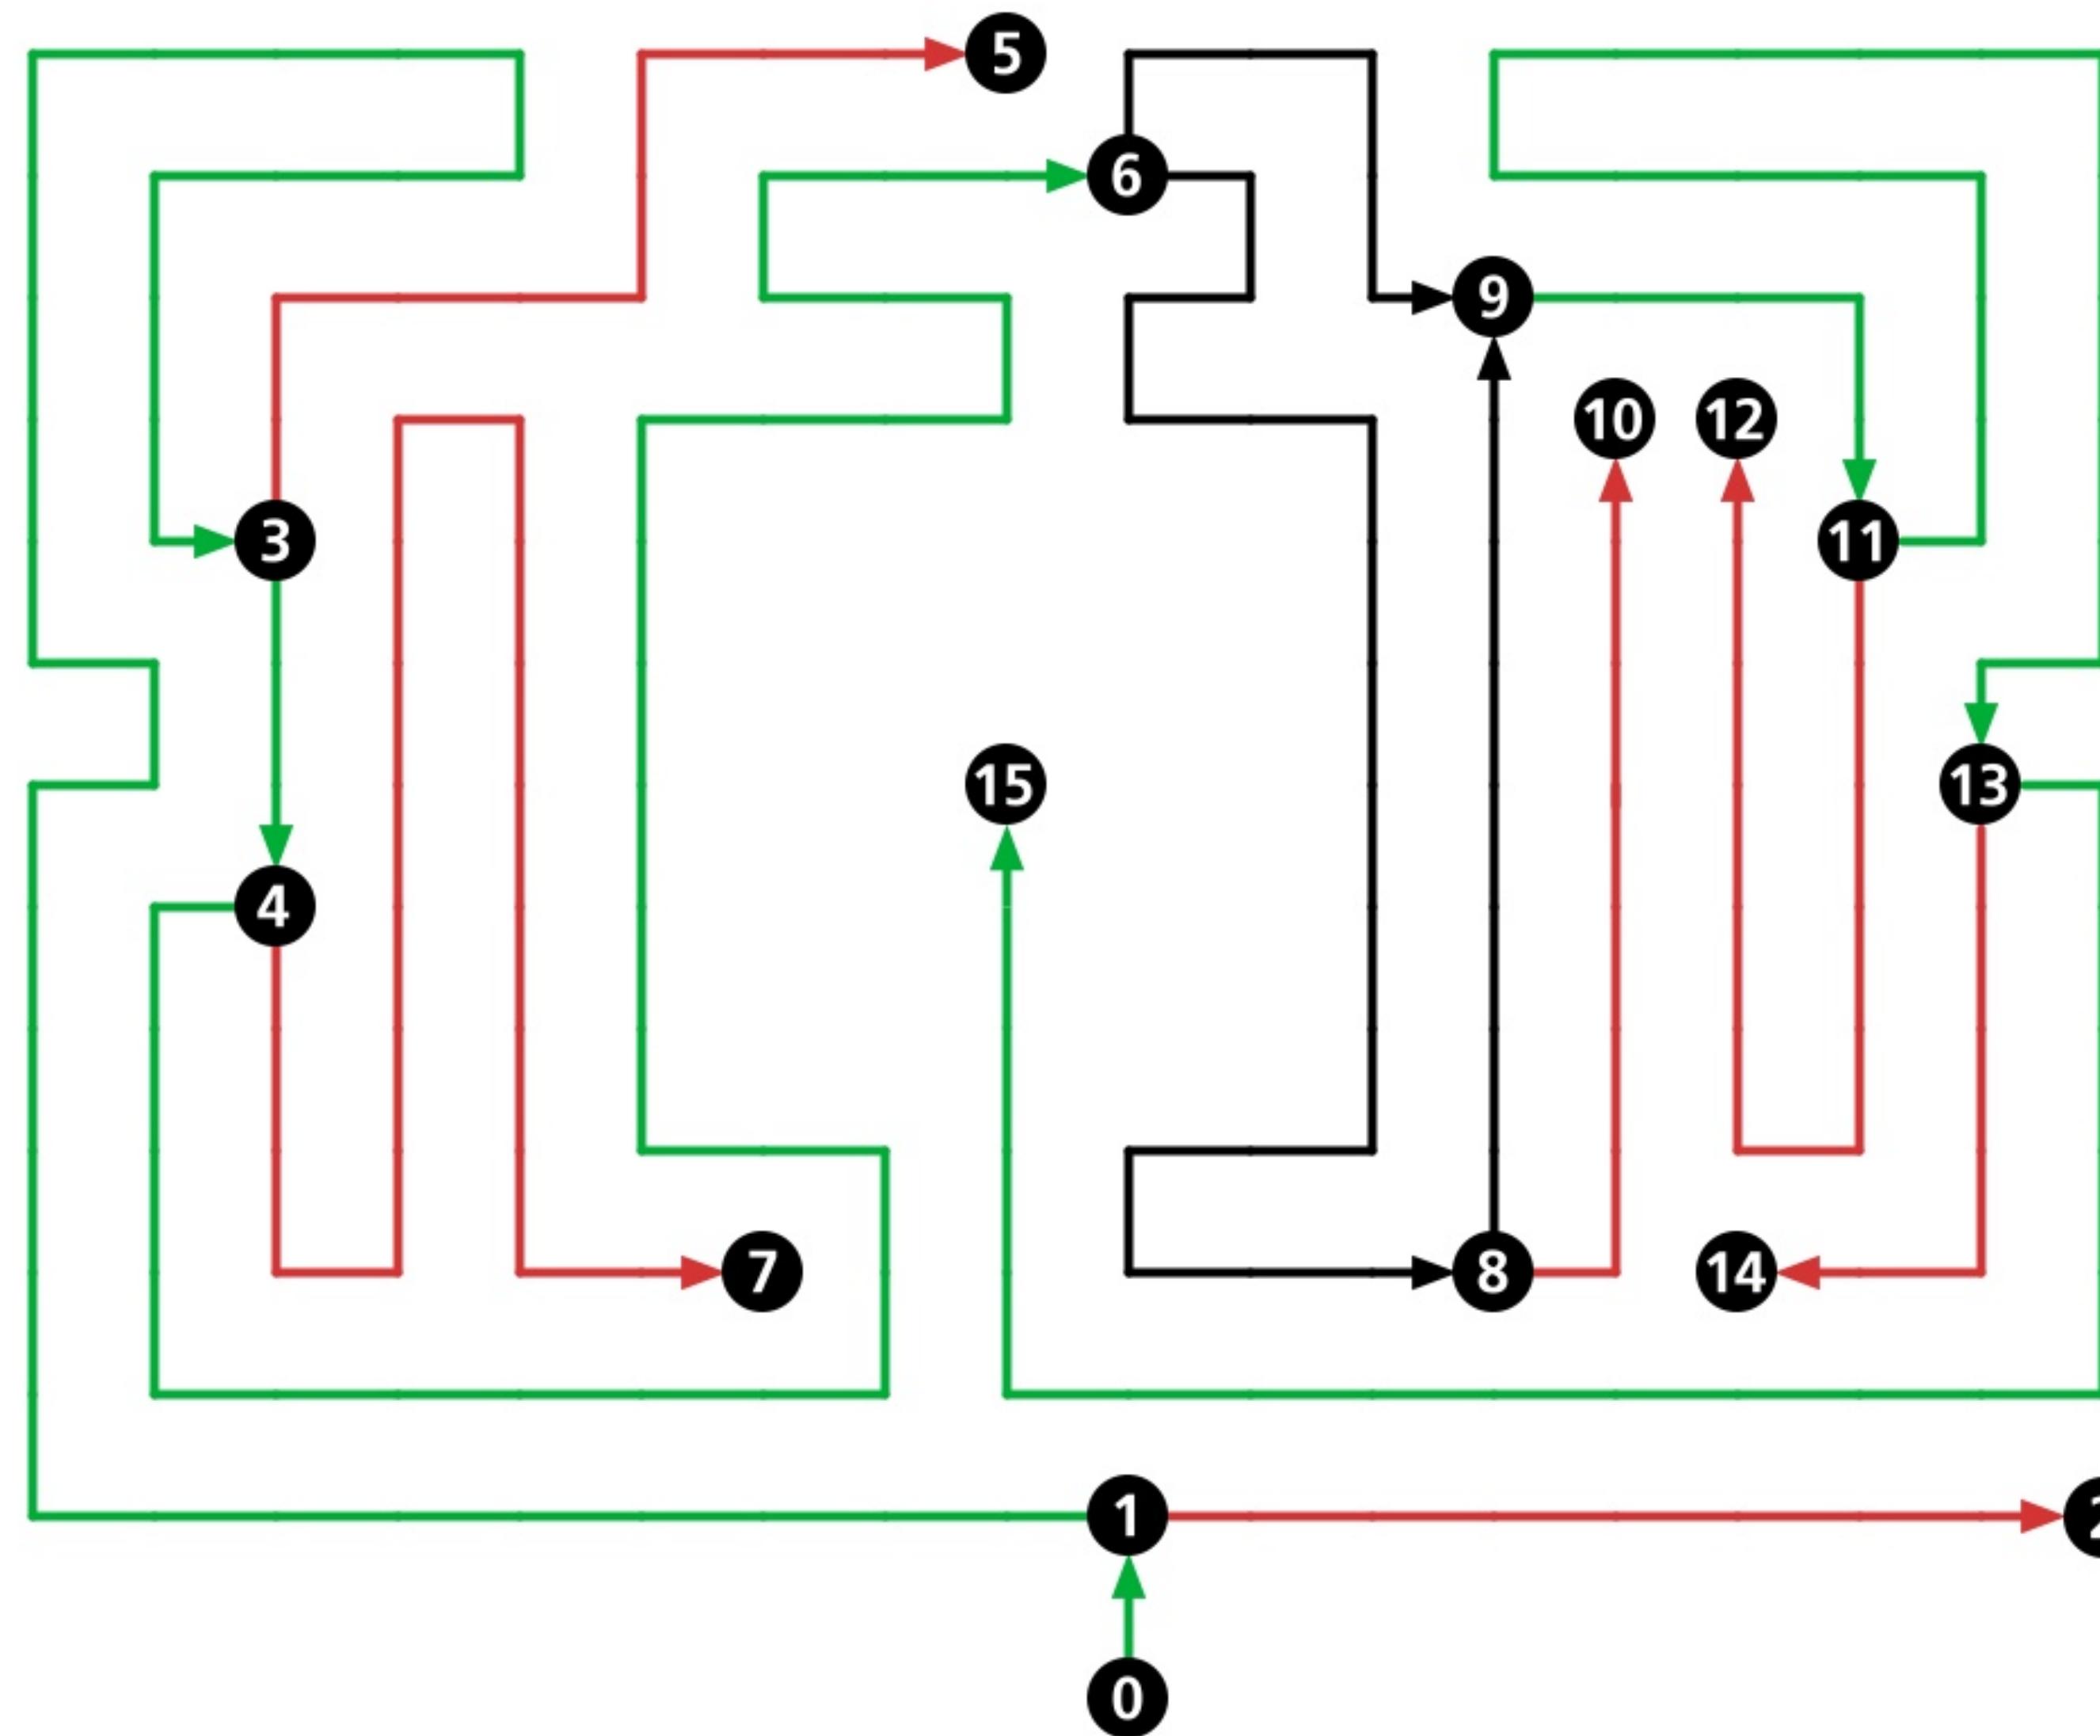

Experimental study of the mental processes of the rat

Willard Small (1901). *American Journal of Psychology*

Experimental study of the mental processes of the rat

Willard Small (1901). *American Journal of Psychology*

Maze behavior of laboratory rats

Motivation

Present need (viz hunger)

Initial exploration

Trial-and-error search

Tentative solutions with repeated trials

Speed increases on runways

Hesitation & errors decrease at choice points

Habitual solution with 'over-training'

Automatic movements along fixed path to food

Favor shorter path, over longer one

'Error-free' runs of true path of 40 feet in under 20 seconds

Natural behavior of wild rats

Motivation

Cautious curiosity about resources & dangers

Investment in future needs, not just present ones

Continual exploration interleaved with exploitation

Explore novel paths for undiscovered shortcuts & resources

Monitor familiar paths for emergent shortcuts, obstacles, resources & dangers

Home-base behaviors (grooming, rearing, circling)

Starting place, or another place with natural protection

Outward exploration (foraging)

Slow steps & circuitous paths, avoiding open spaces & following walls

Revisit familiar places & discover new ones

Approach & avoid behaviors (appetite, aversion)

Sample food for taste & wholesomeness

Defense (freeze, flee or fight) & post-threat (vigilance & place aversion) behaviors

Homeward run by a rapid beeline path

The determiners of behavior at a choice point

Edward Tolman (1938). *Psychological Review*

Latent learning

Law-of-effect explained trial-and-error learning from rewarded runs

Not latent learning from exploring the maze before food is added

Nor selecting alternative path to water when thirsty

Route planning (insight)

Detour around new obstacle

Shortcut through new passage

Tolman's take-home message

Learning & reasoning seen best by changing means-ends problem

Cognitive maps in rats & men

Edward Tolman (1948). *Psychological Review*

Initial exploration, narrow feature-poor map

Single path from start to finish

Attend **few features**

Routine exploitation, broad feature-rich map

Multiple paths between any two places on the map

Attend **many features**

Paradox of habit

Cognitive map **broadens** from new experience

Habitual paths **narrow** with repeated practice

Habit formation

Two kinds of memory, or one kind with several levels

Hand-off from flexible plans to rigid habits

From **motivated** behavior to **automatic** behavior (James 1890)

From **place** learning to **response** learning (Tolman & students 1946-48)

From **locale** system to **taxon** system (O'Keefe & Nadel 1978)

Downward distribution of plans within hierarchical map

Plans narrow even as **map broadens**

Use-dependent **memory consolidation** to lower levels

Use-dependent **program compilation** to lower levels

My research & today's talk

Icebergs, intuitions & a few results

Formulate the problem & what a solution might look like

When a plan screws up!

The contract is breached at a CWA

Plans and the Structure of Behavior

Miller, Galanter & Pribram (1960)

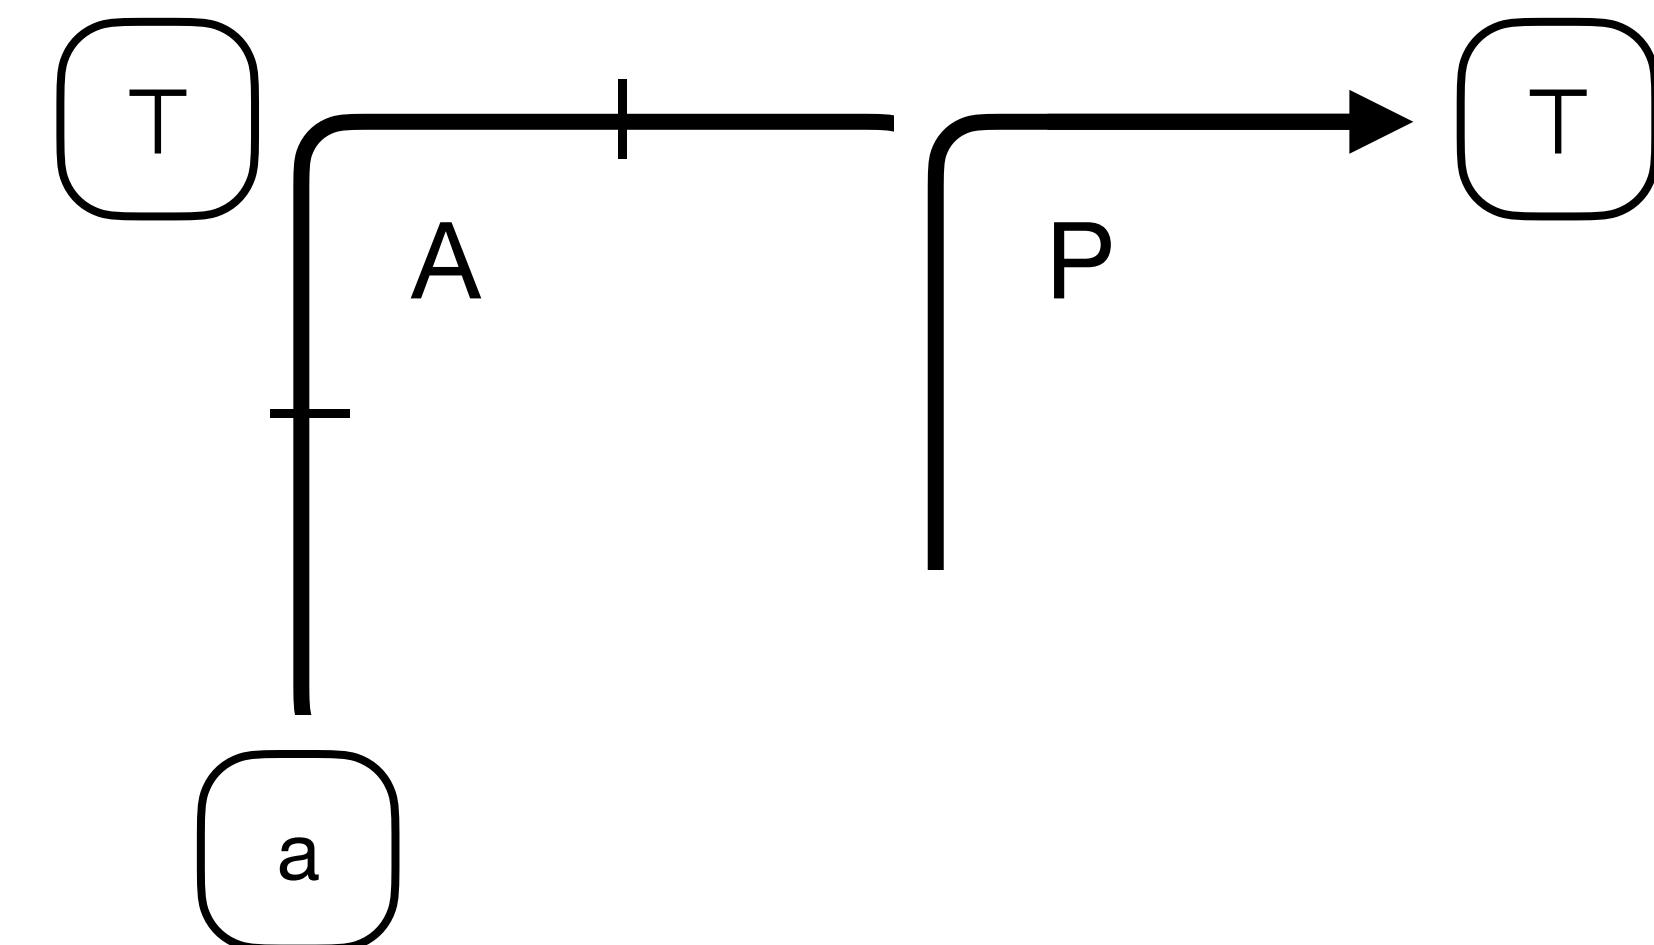

TOTE units

test-operate-test-exit

While programs

while A do P

TOTE unit

An axiomatic basis for computer programming

C.A.R. Hoare (1969). CACM

Antoine de Saint-Exupéry

"A goal without a plan is just a wish"

Tony Hoare

"A plan without a goal is just a program"

Partial correctness assertion, or contract

$\{A\} P \{B\}$

{assume} program {assert}

Relation algebra (Tarski & Givant 1987)

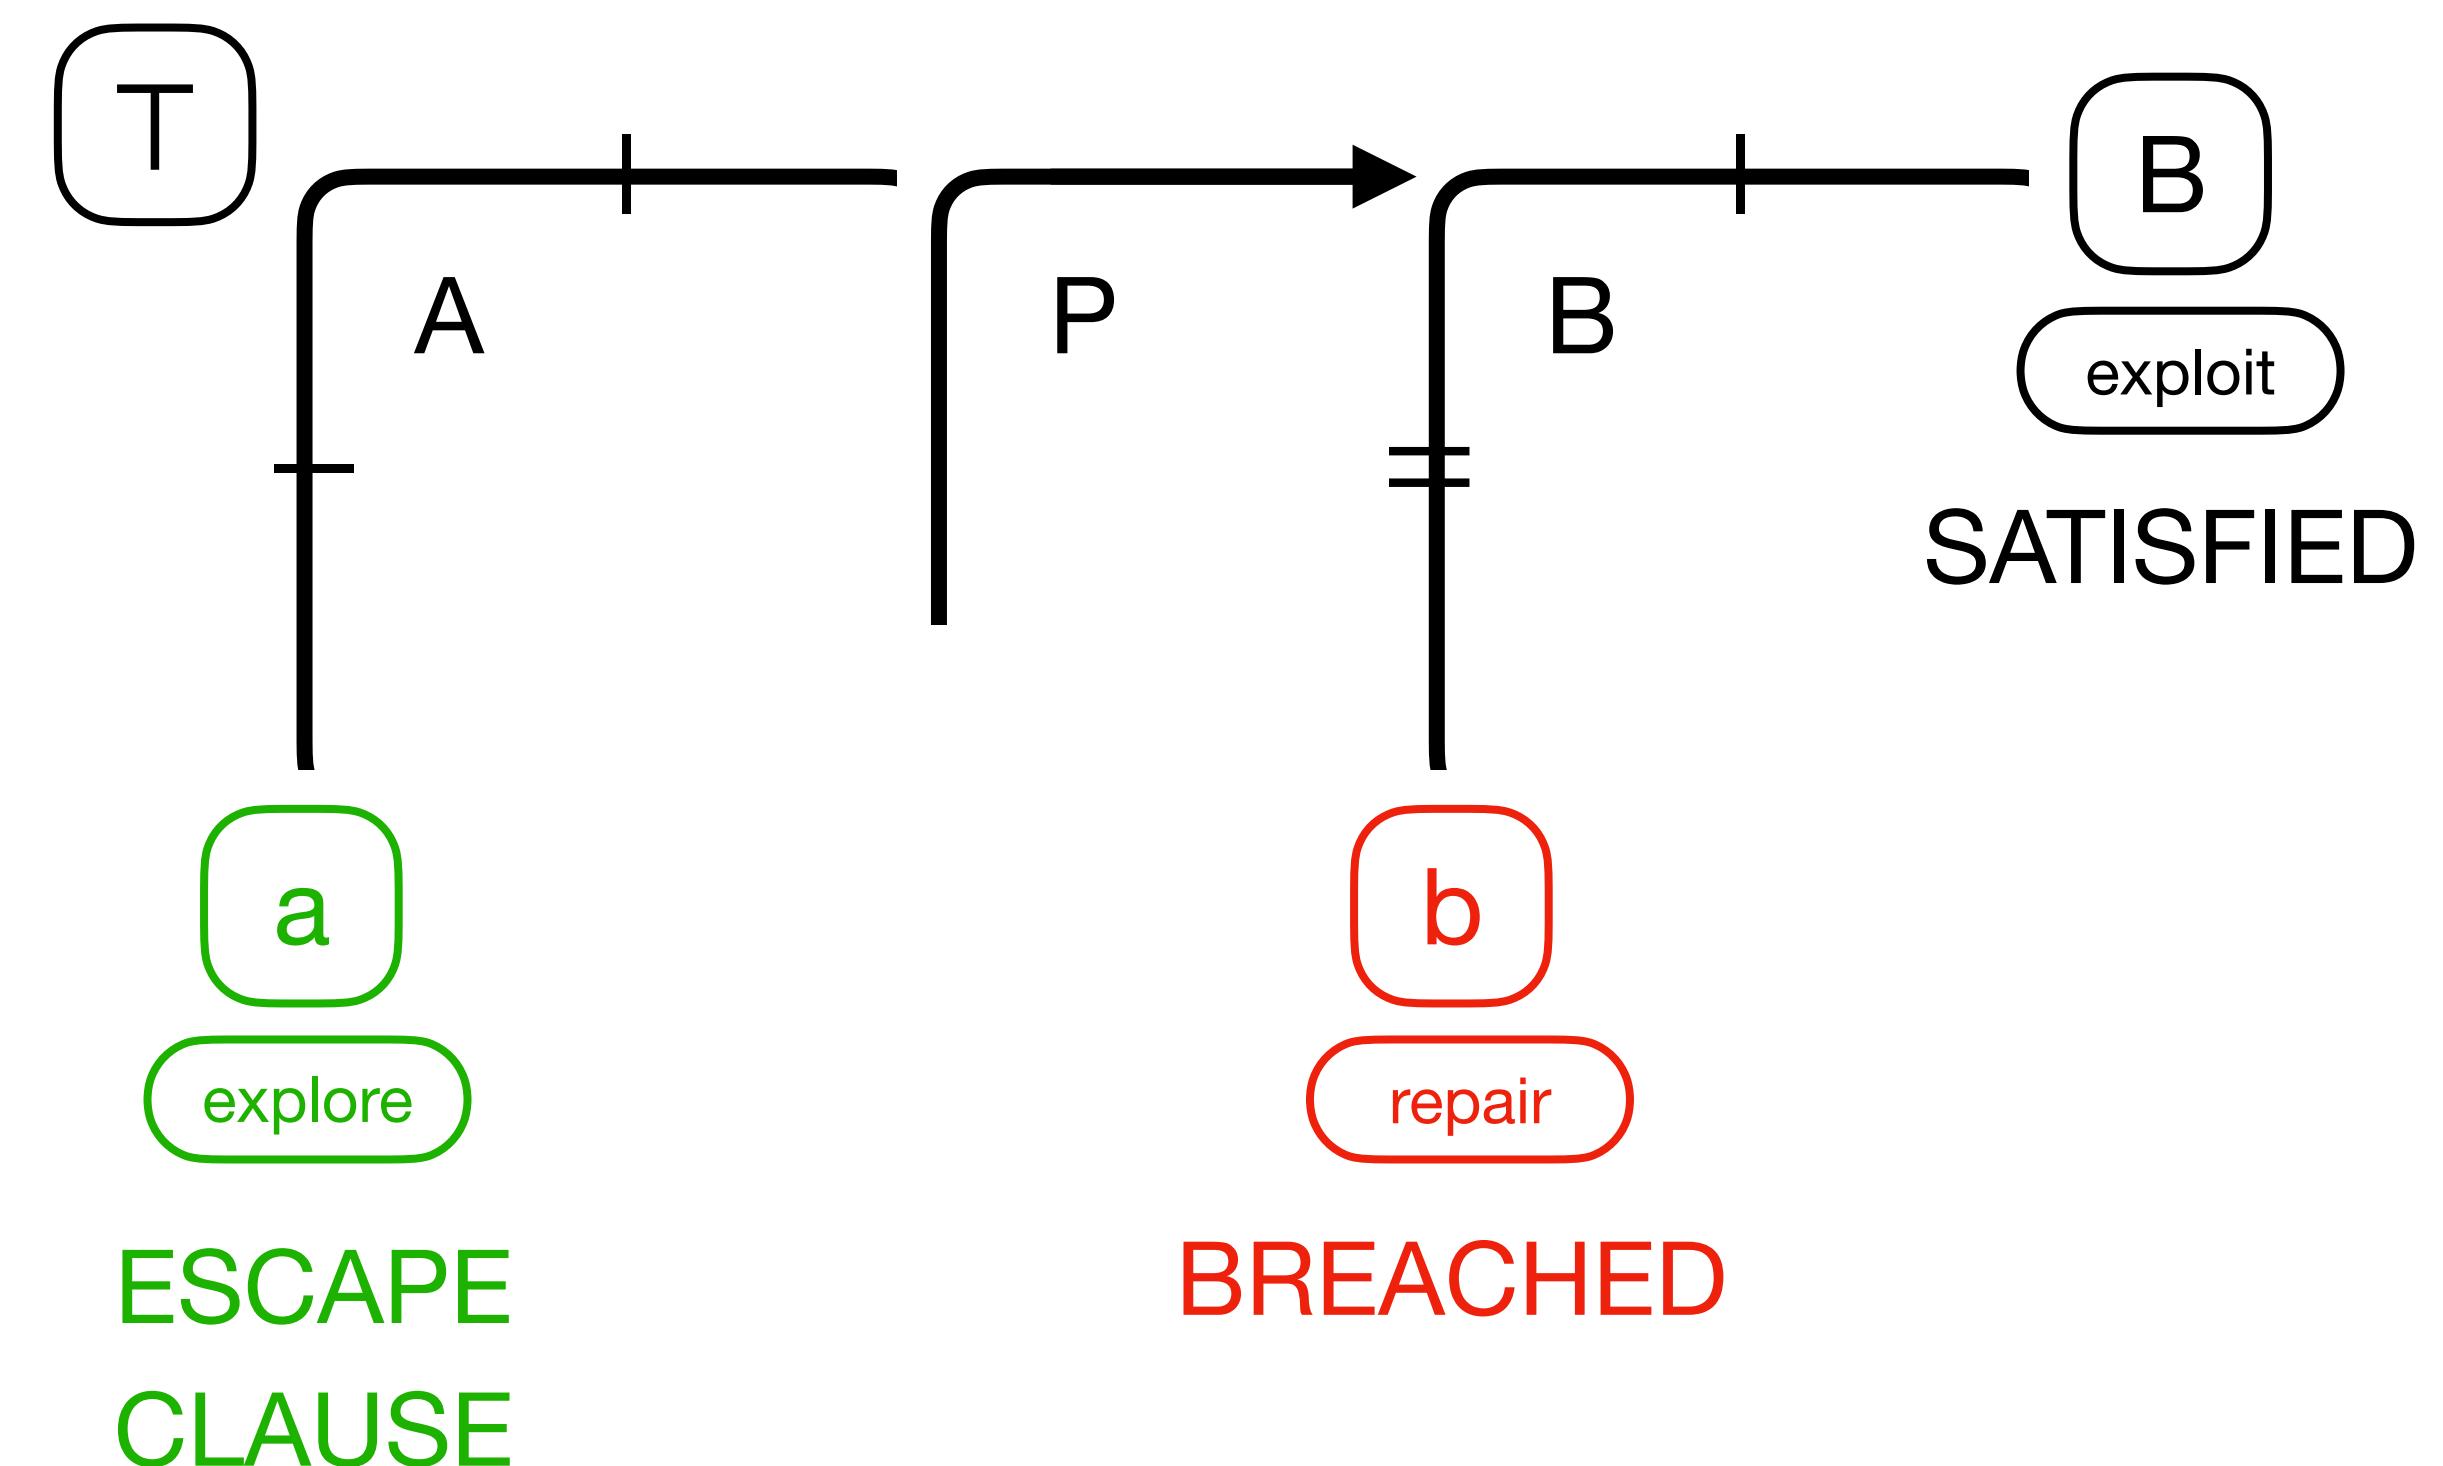

$(A \times b) \cdot P = 0$

breach \cdot **program** = 0

Kleene algebra with tests (Kozen 2000)

$APb = 0$

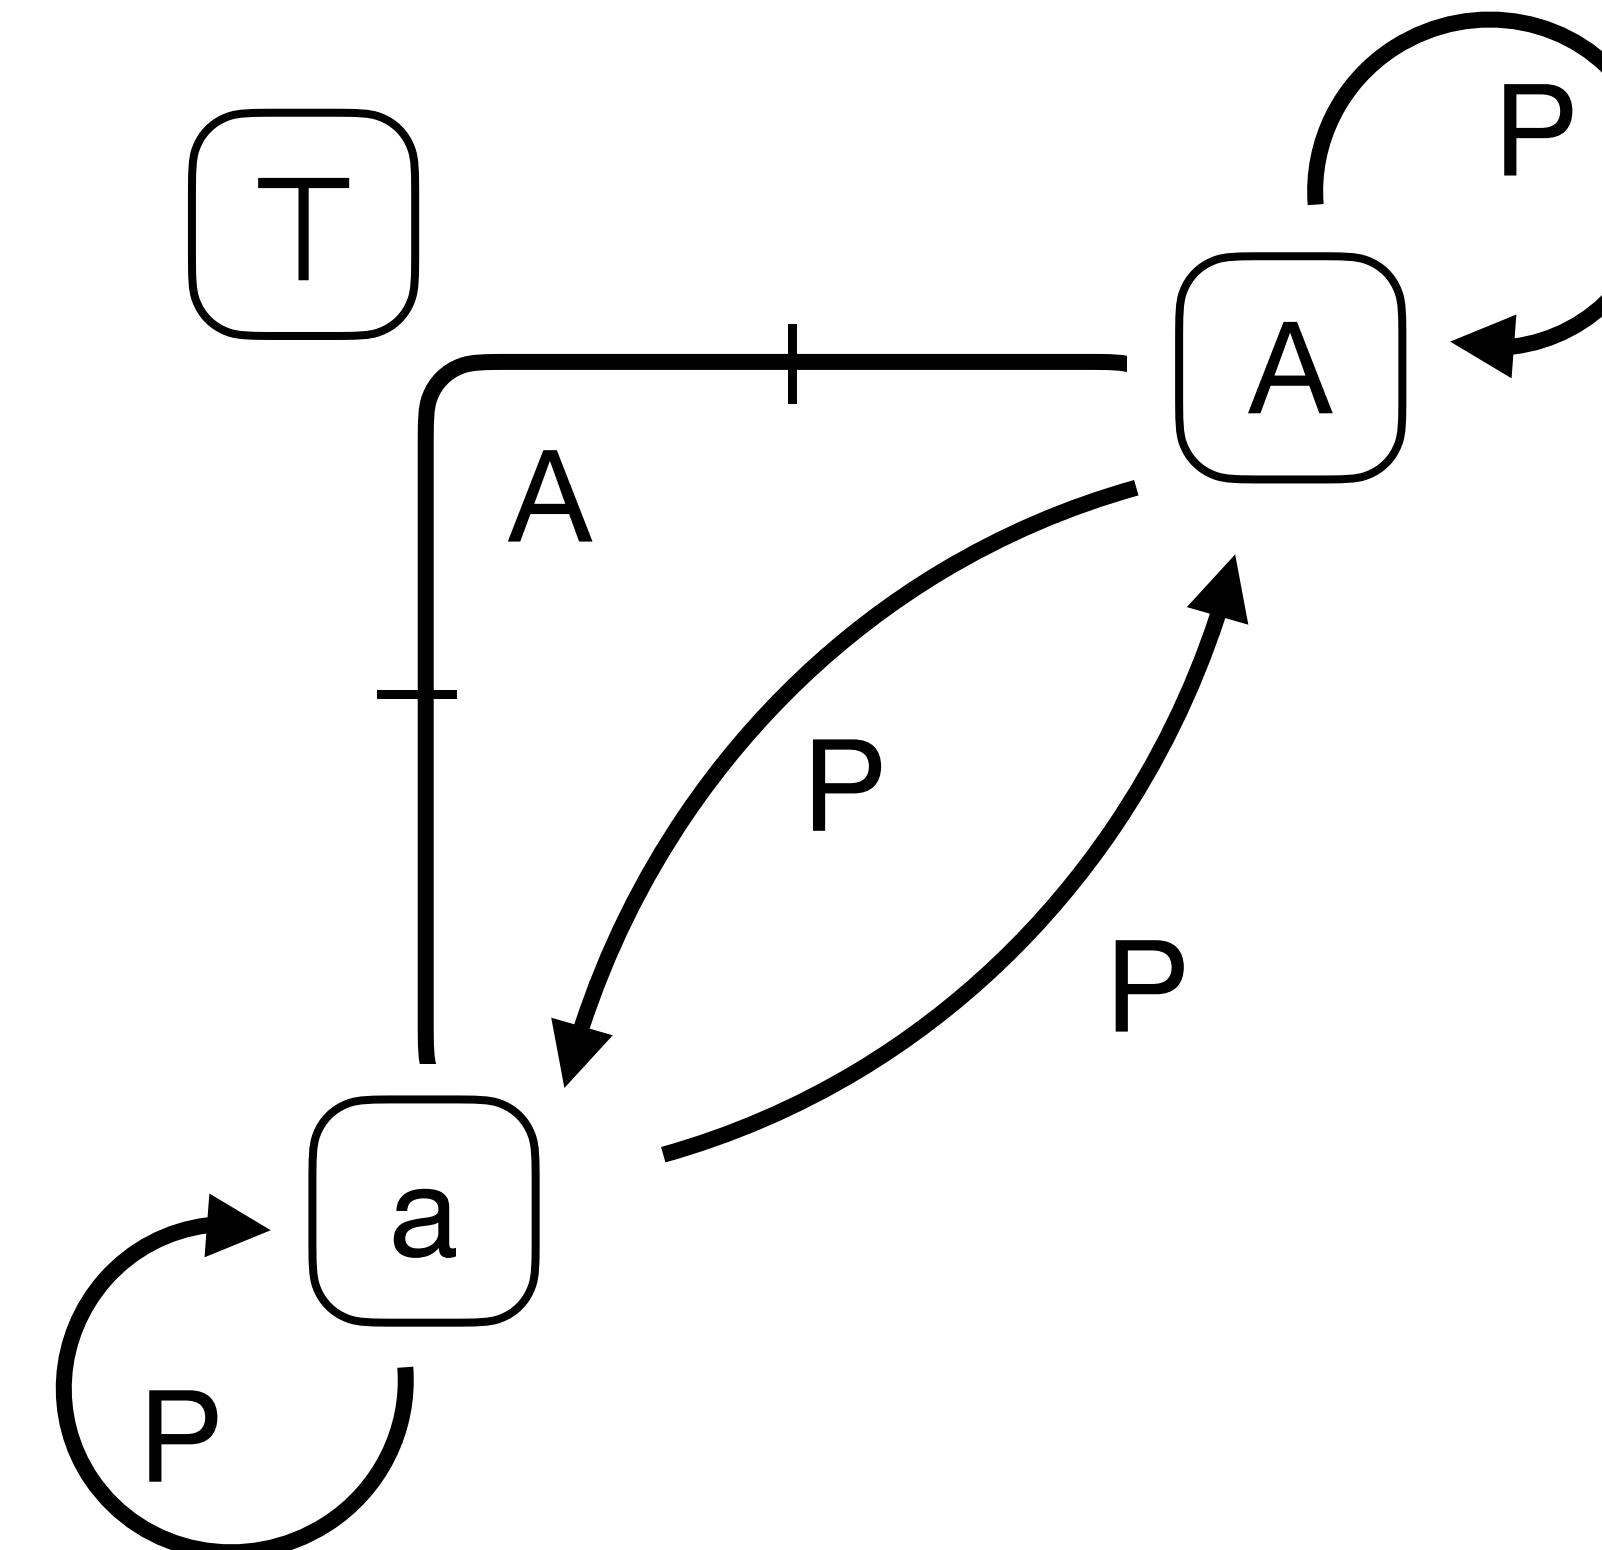

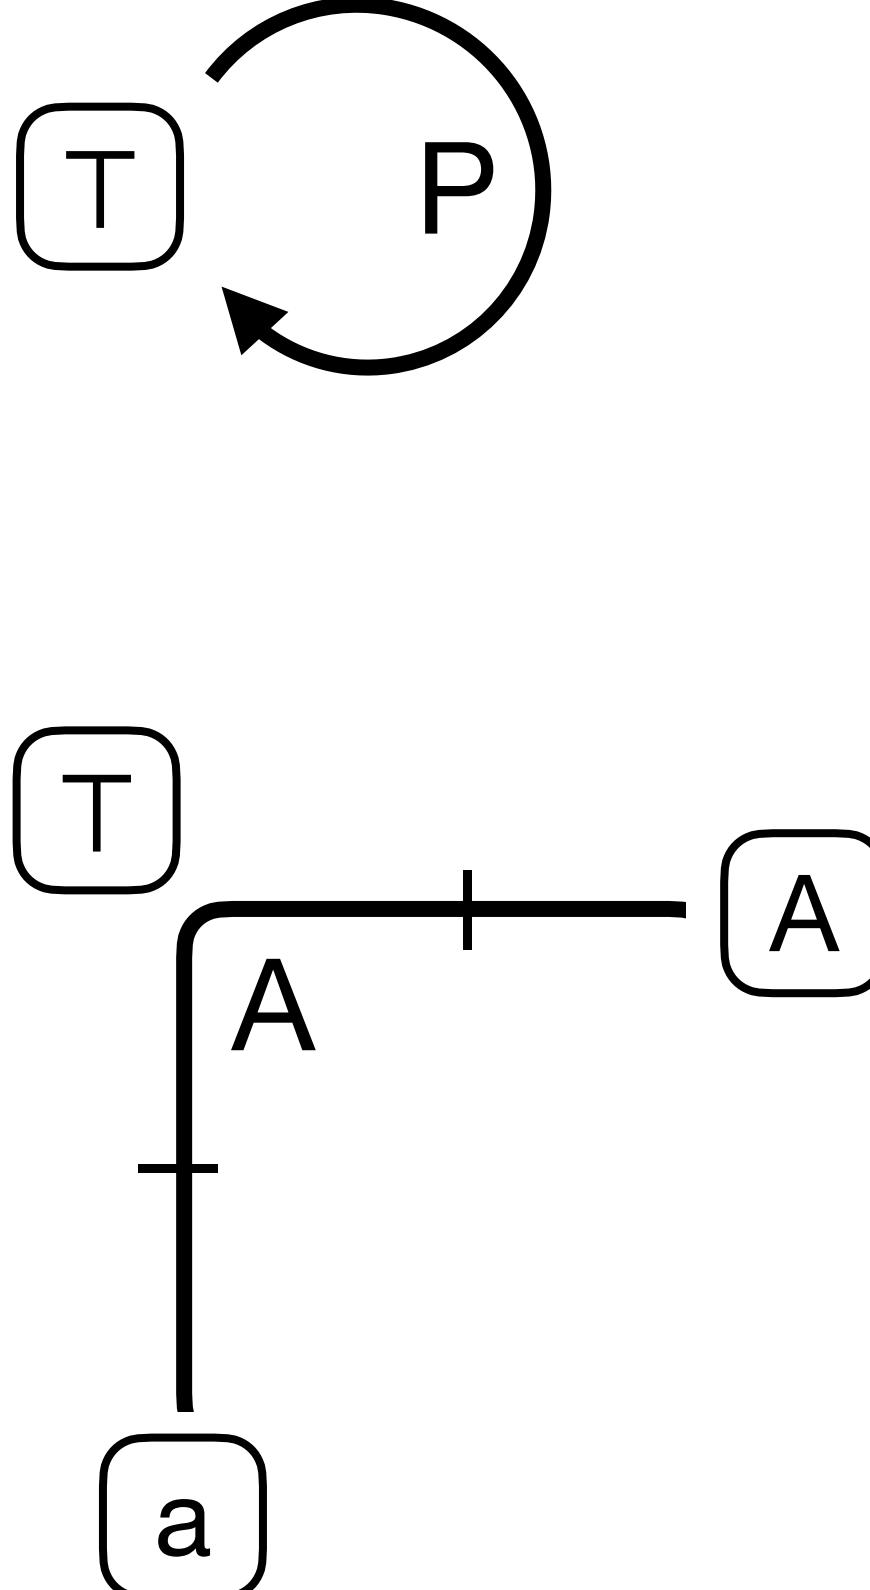

$\overline{\Diamond} APb$

Every move & test specifies four plans

stay off + turn off + stay on + turn on

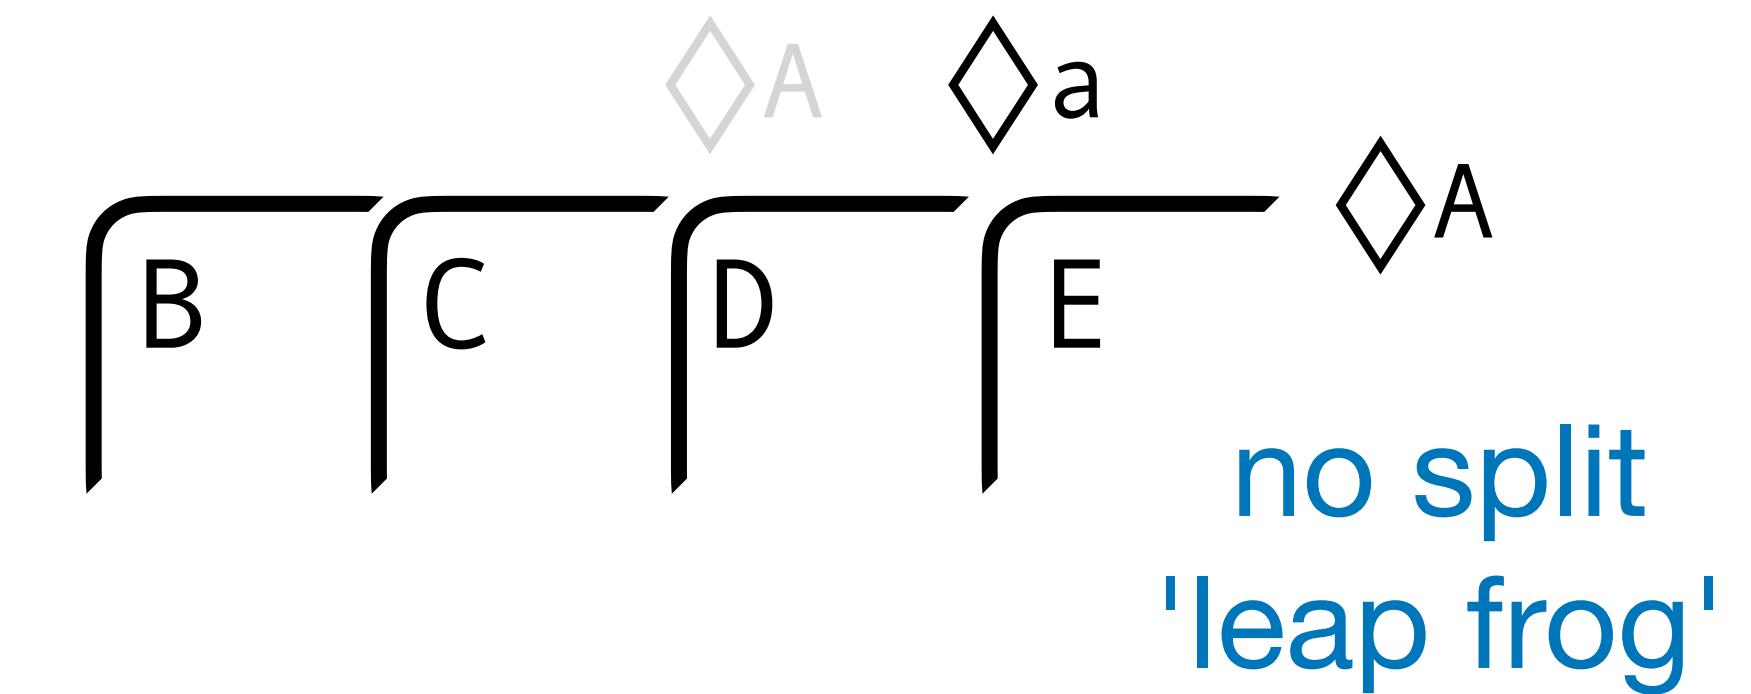

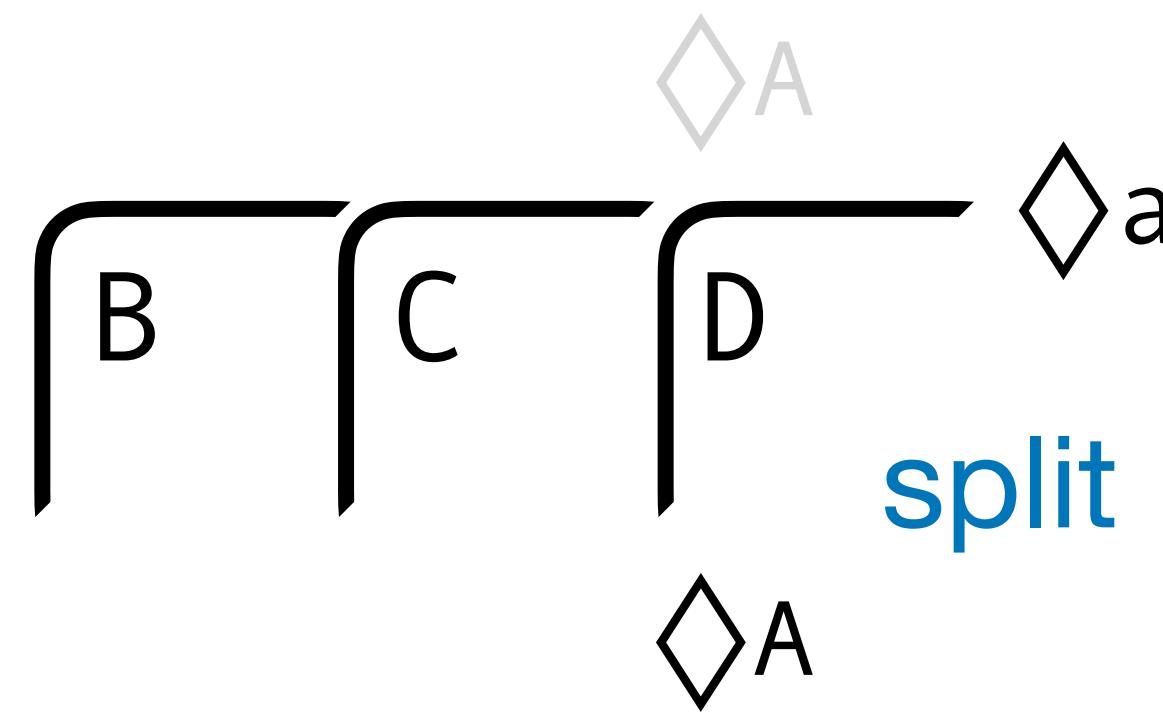

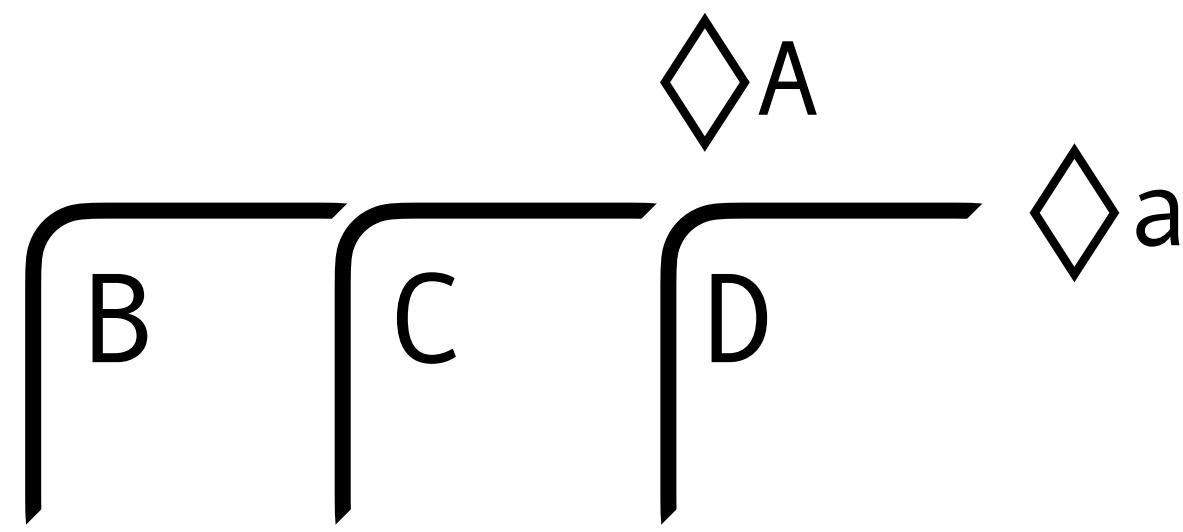

write off + write on

$$\begin{aligned} \{T\}P\{T\} &= \{a\}P\{a\} + \{A\}P\{a\} + \{A\}P\{A\} + \{a\}P\{A\} \\ &= \{T\}P\{a\} + \{T\}P\{A\} \end{aligned}$$

Minimally curious student

$\diamond ABC$

$\diamond aBCD$

$\diamond ABC$

$\diamond aBCD$

$\diamond ABCd$

$\diamond ABC$

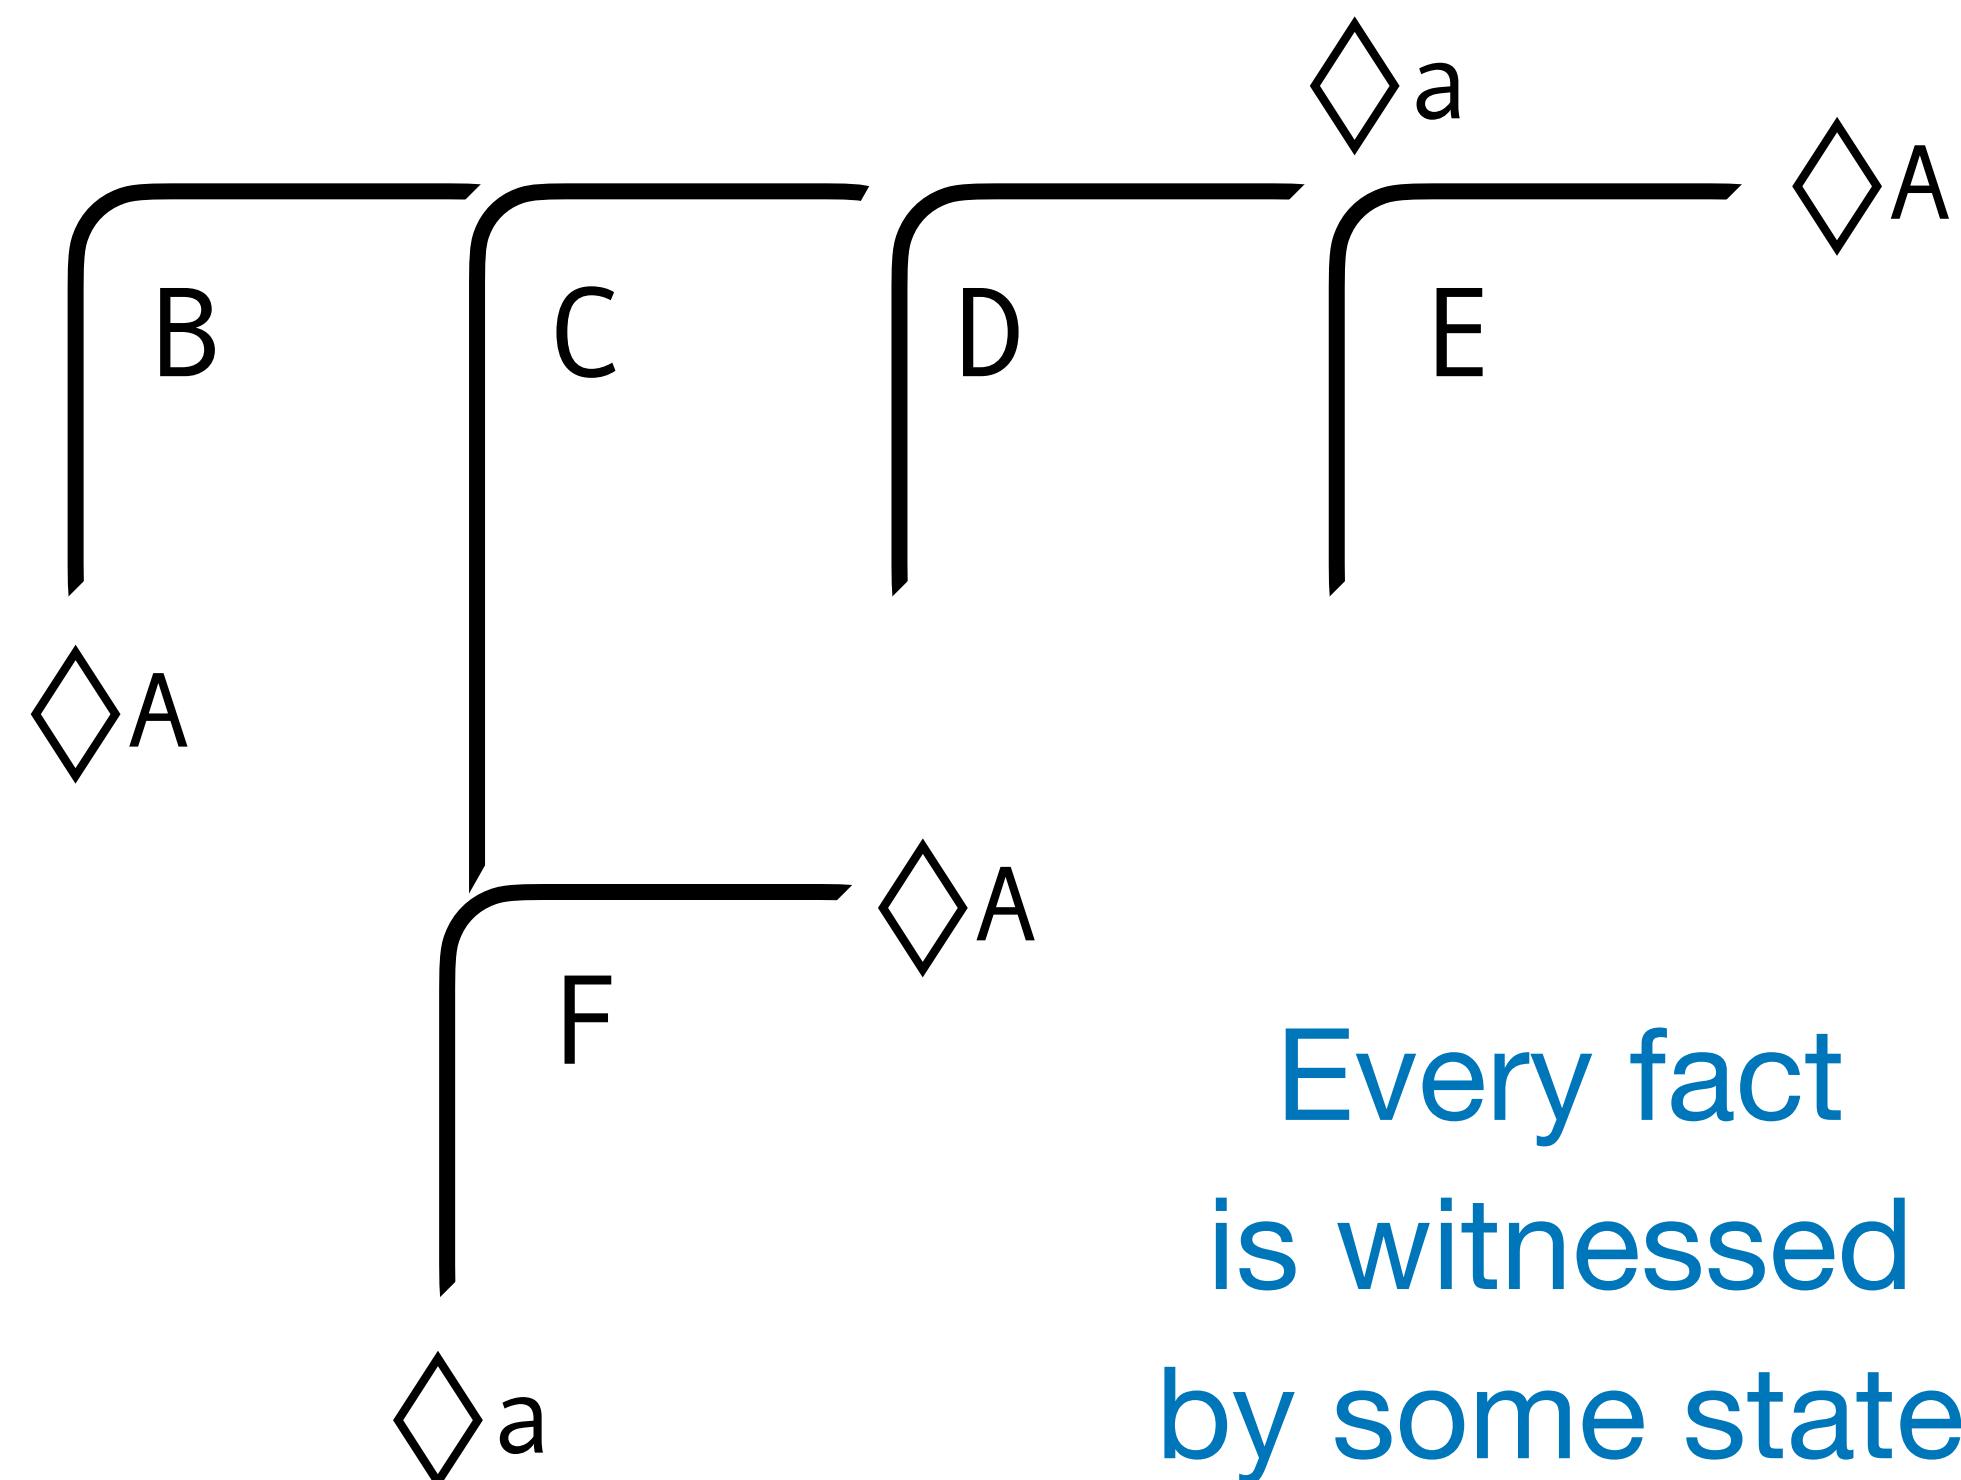

$\diamond aBCD$

$\diamond ABCDE$

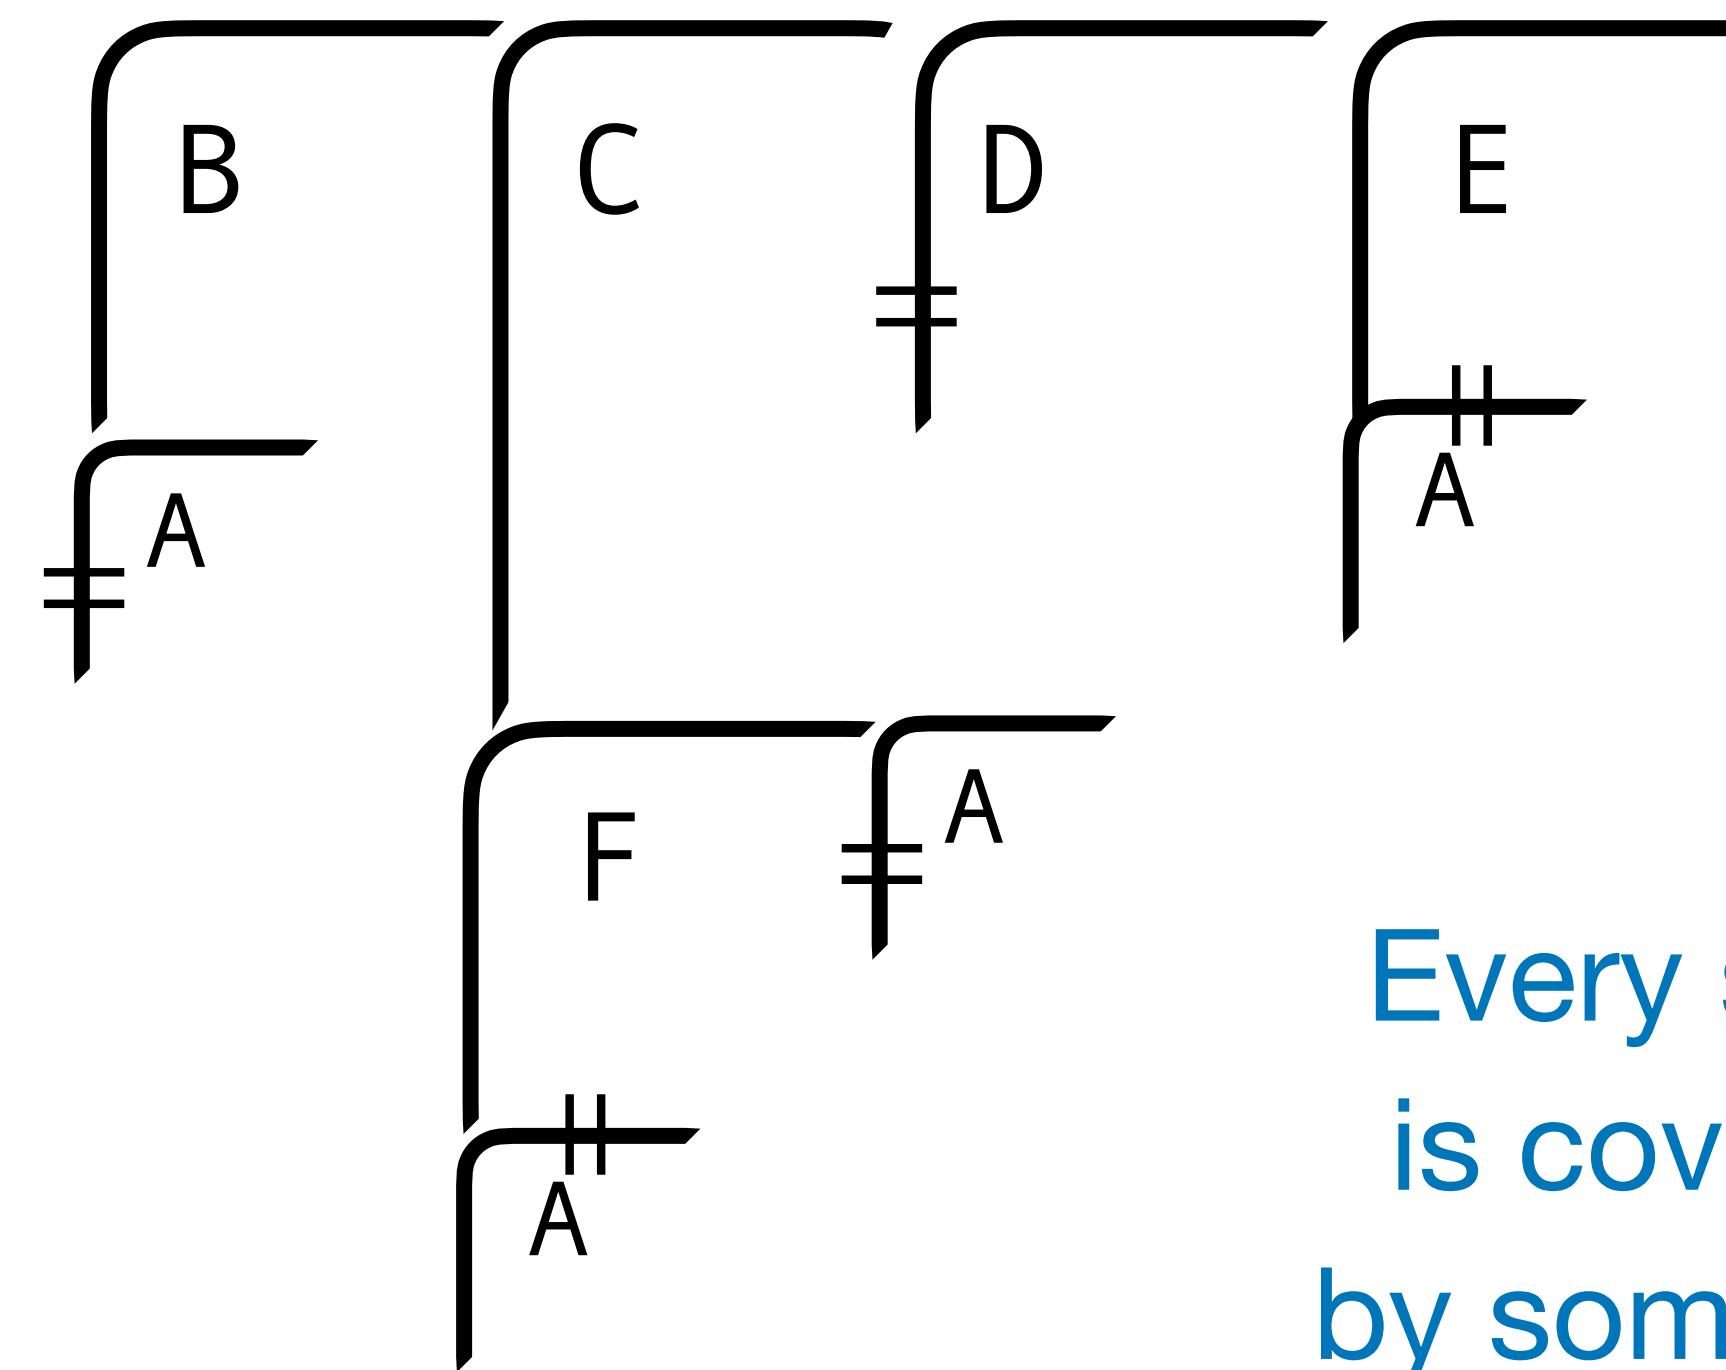

Closed world assumption

"absence of evidence is evidence of absence"

Facts

Closed-world belief

Combining decision trees

One stronger fact that explains two consistent facts?

$\diamond ABC$
 $\diamond BCD$
? $\diamond ABCD$

$\diamond ABC$
 $\diamond BCD$
 $\diamond ABCD$

Yes

$\diamond ABC$
 $\diamond BCD$
 $\diamond ABCd$

No

Metaphor of learning & memory

Facts accrue monotonically, beliefs are defeasible

Fact trees

Add new fact

Strengthen old fact

Delete two consistent facts with one stronger fact

Swiss cheese

Add new bubble

Shrink old bubble

Delete two overlapping bubbles with one smaller bubble

Monotonic increase of distinguished states

Increase in number of isolated bubbles & decrease in size

But all these records come at a cost!

Computational complexity of exploration

Kleene automata are learnable by experiment, not observation alone

x

Passive
observation

Unzips initial differences

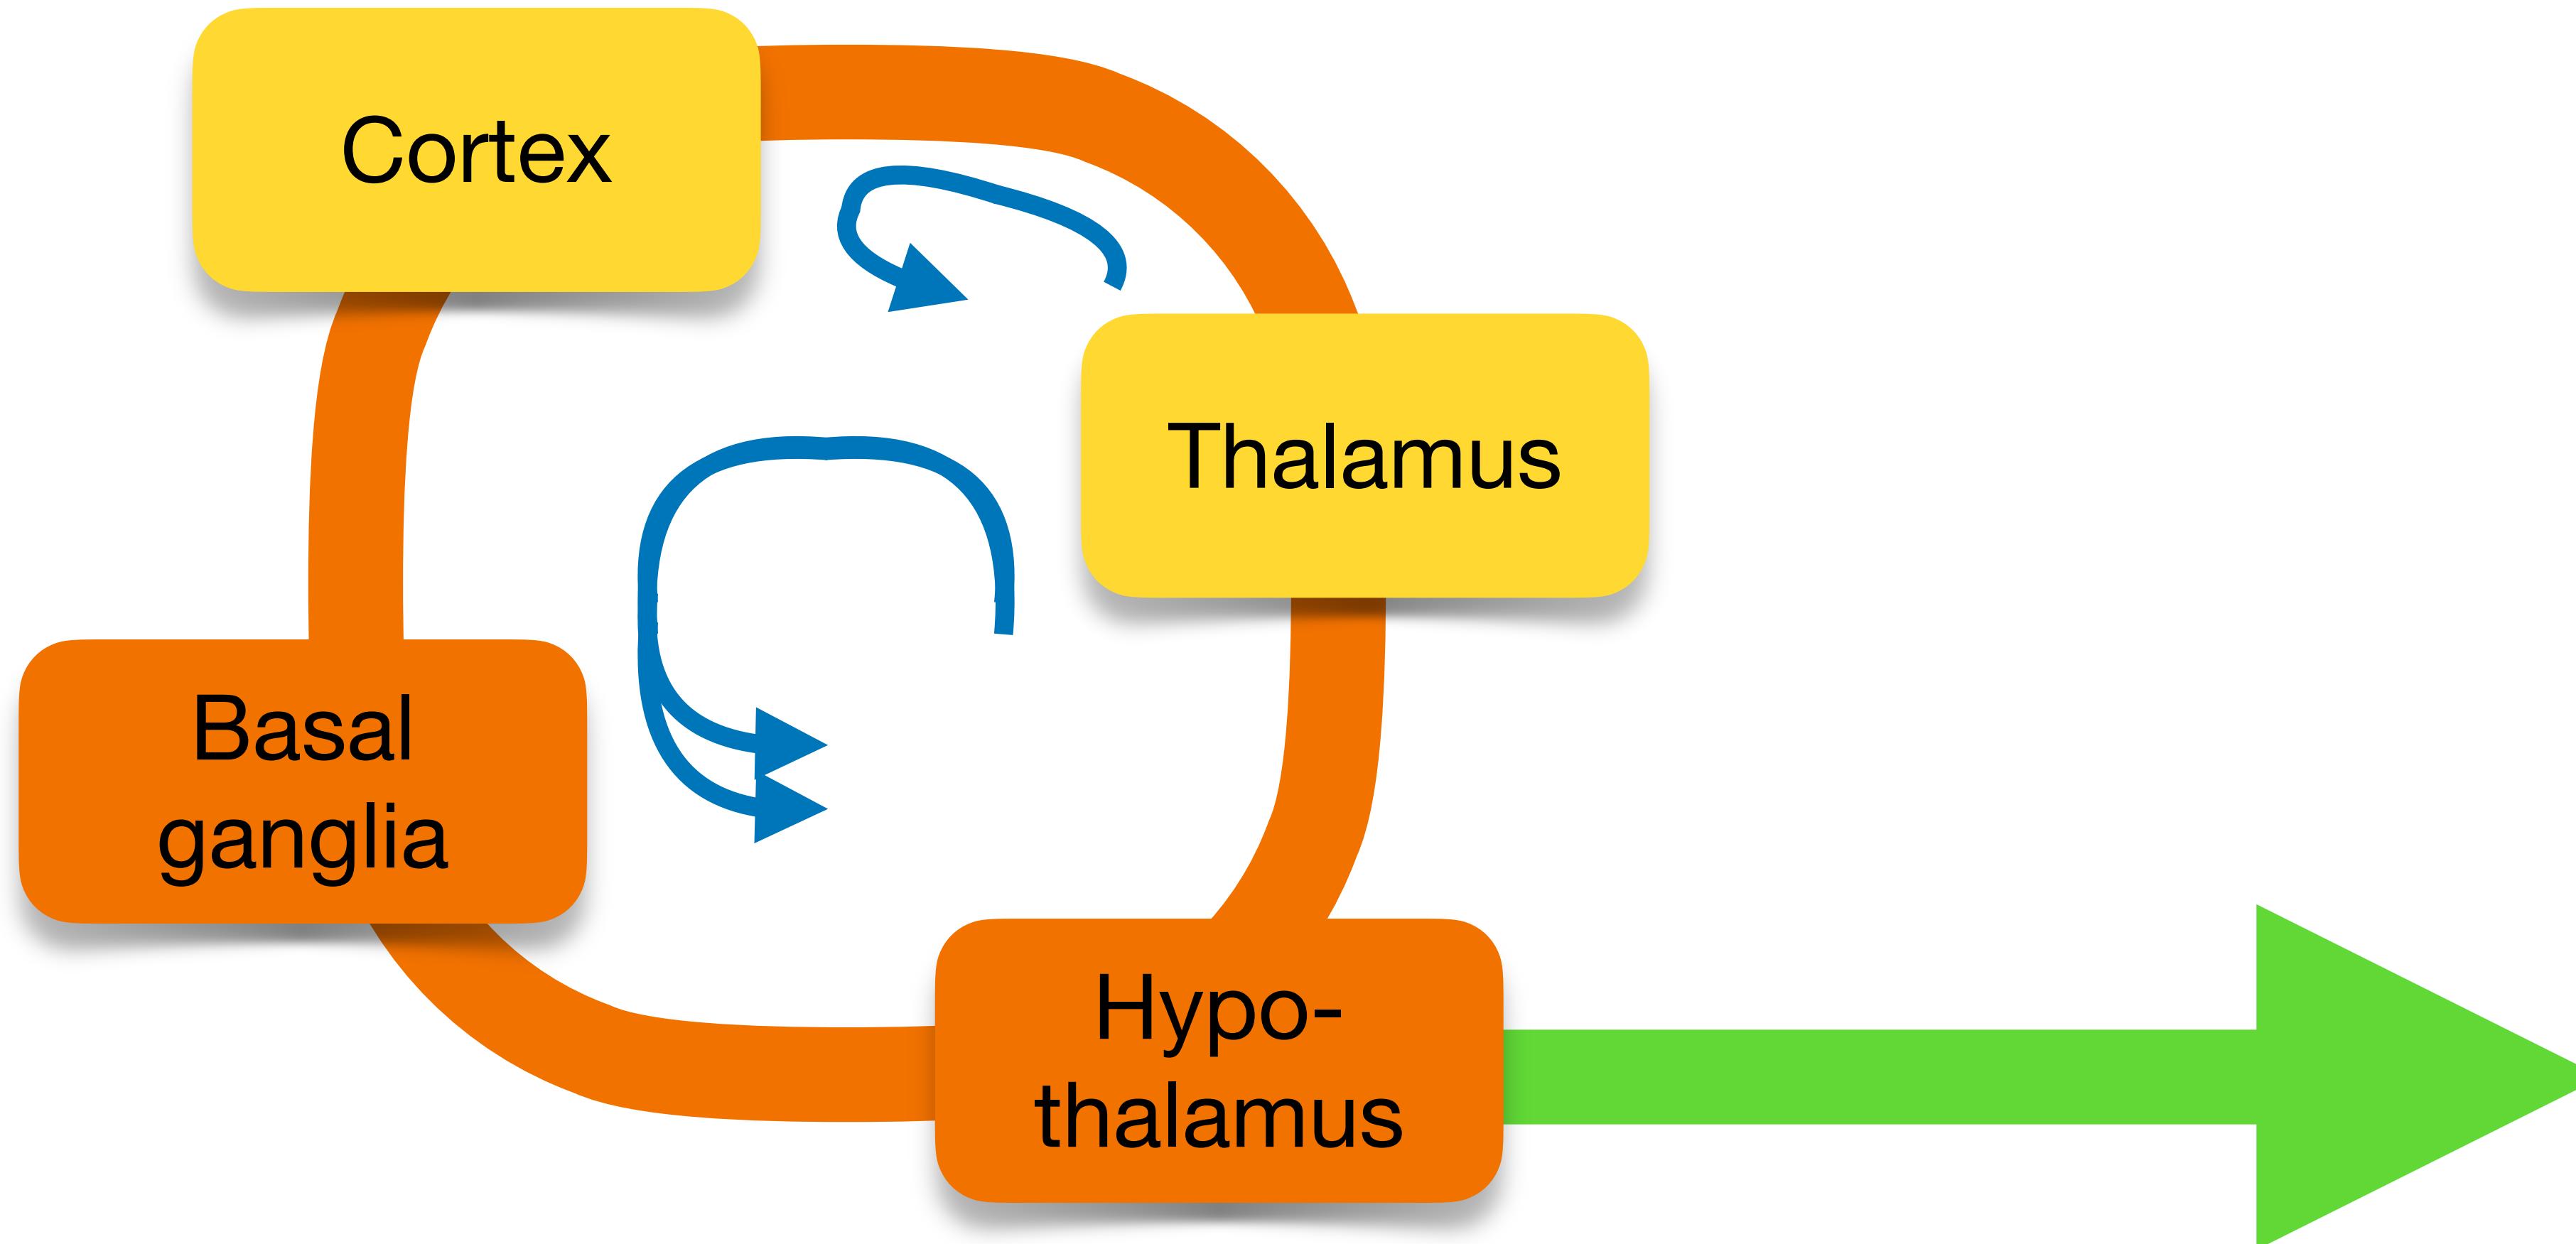

Maximally forgetful professor

Zips final differences

What of the cerebrum?

Formal explanations & neural realizations

Cognitive maps in rats & men

Edward Tolman (1948). *Psychological Review*

Five conditions for narrow maps

- Initial exploration of novel maze
- Feature-poor maze
- Habitual path through a familiar maze
- Extreme urgency or frustration
- Brain injury

Why the amygdala?

Urgency & frustration : shifting between hot & cold

Shift of problems for planning

From **neutral** to **valenced** constraints

From **appetitive** (*write A*) to **aversive** (*write a*) goals

Shift of mode from planning to acting

From **cold reason** to **hot emotion**

- Dr. Banner becomes The Incredible Hulk

From **cold** to **hot games** (Conway 1978)

Anytime algorithms & triage

Shift of acting from explore to exploit

Shift of acting from higher-level plans to lower-level habits

Two fundamental cognitive processes

acting & planning across wakefulness & sleep

locomotion

acting : active wakefulness

conscious calculation

attentive vigilance

offline acting : REM sleep

dreaming

inattentive immobility

planning : quiet wakefulness

mind-wandering

N1 drowsy pre-sleep

offline planning : NREM sleep

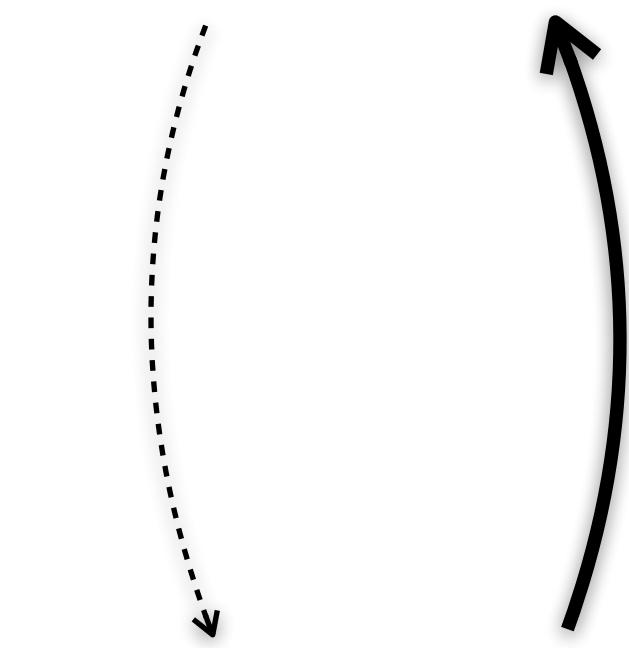

N2/N3 deep sleep

Two fundamental brain modes

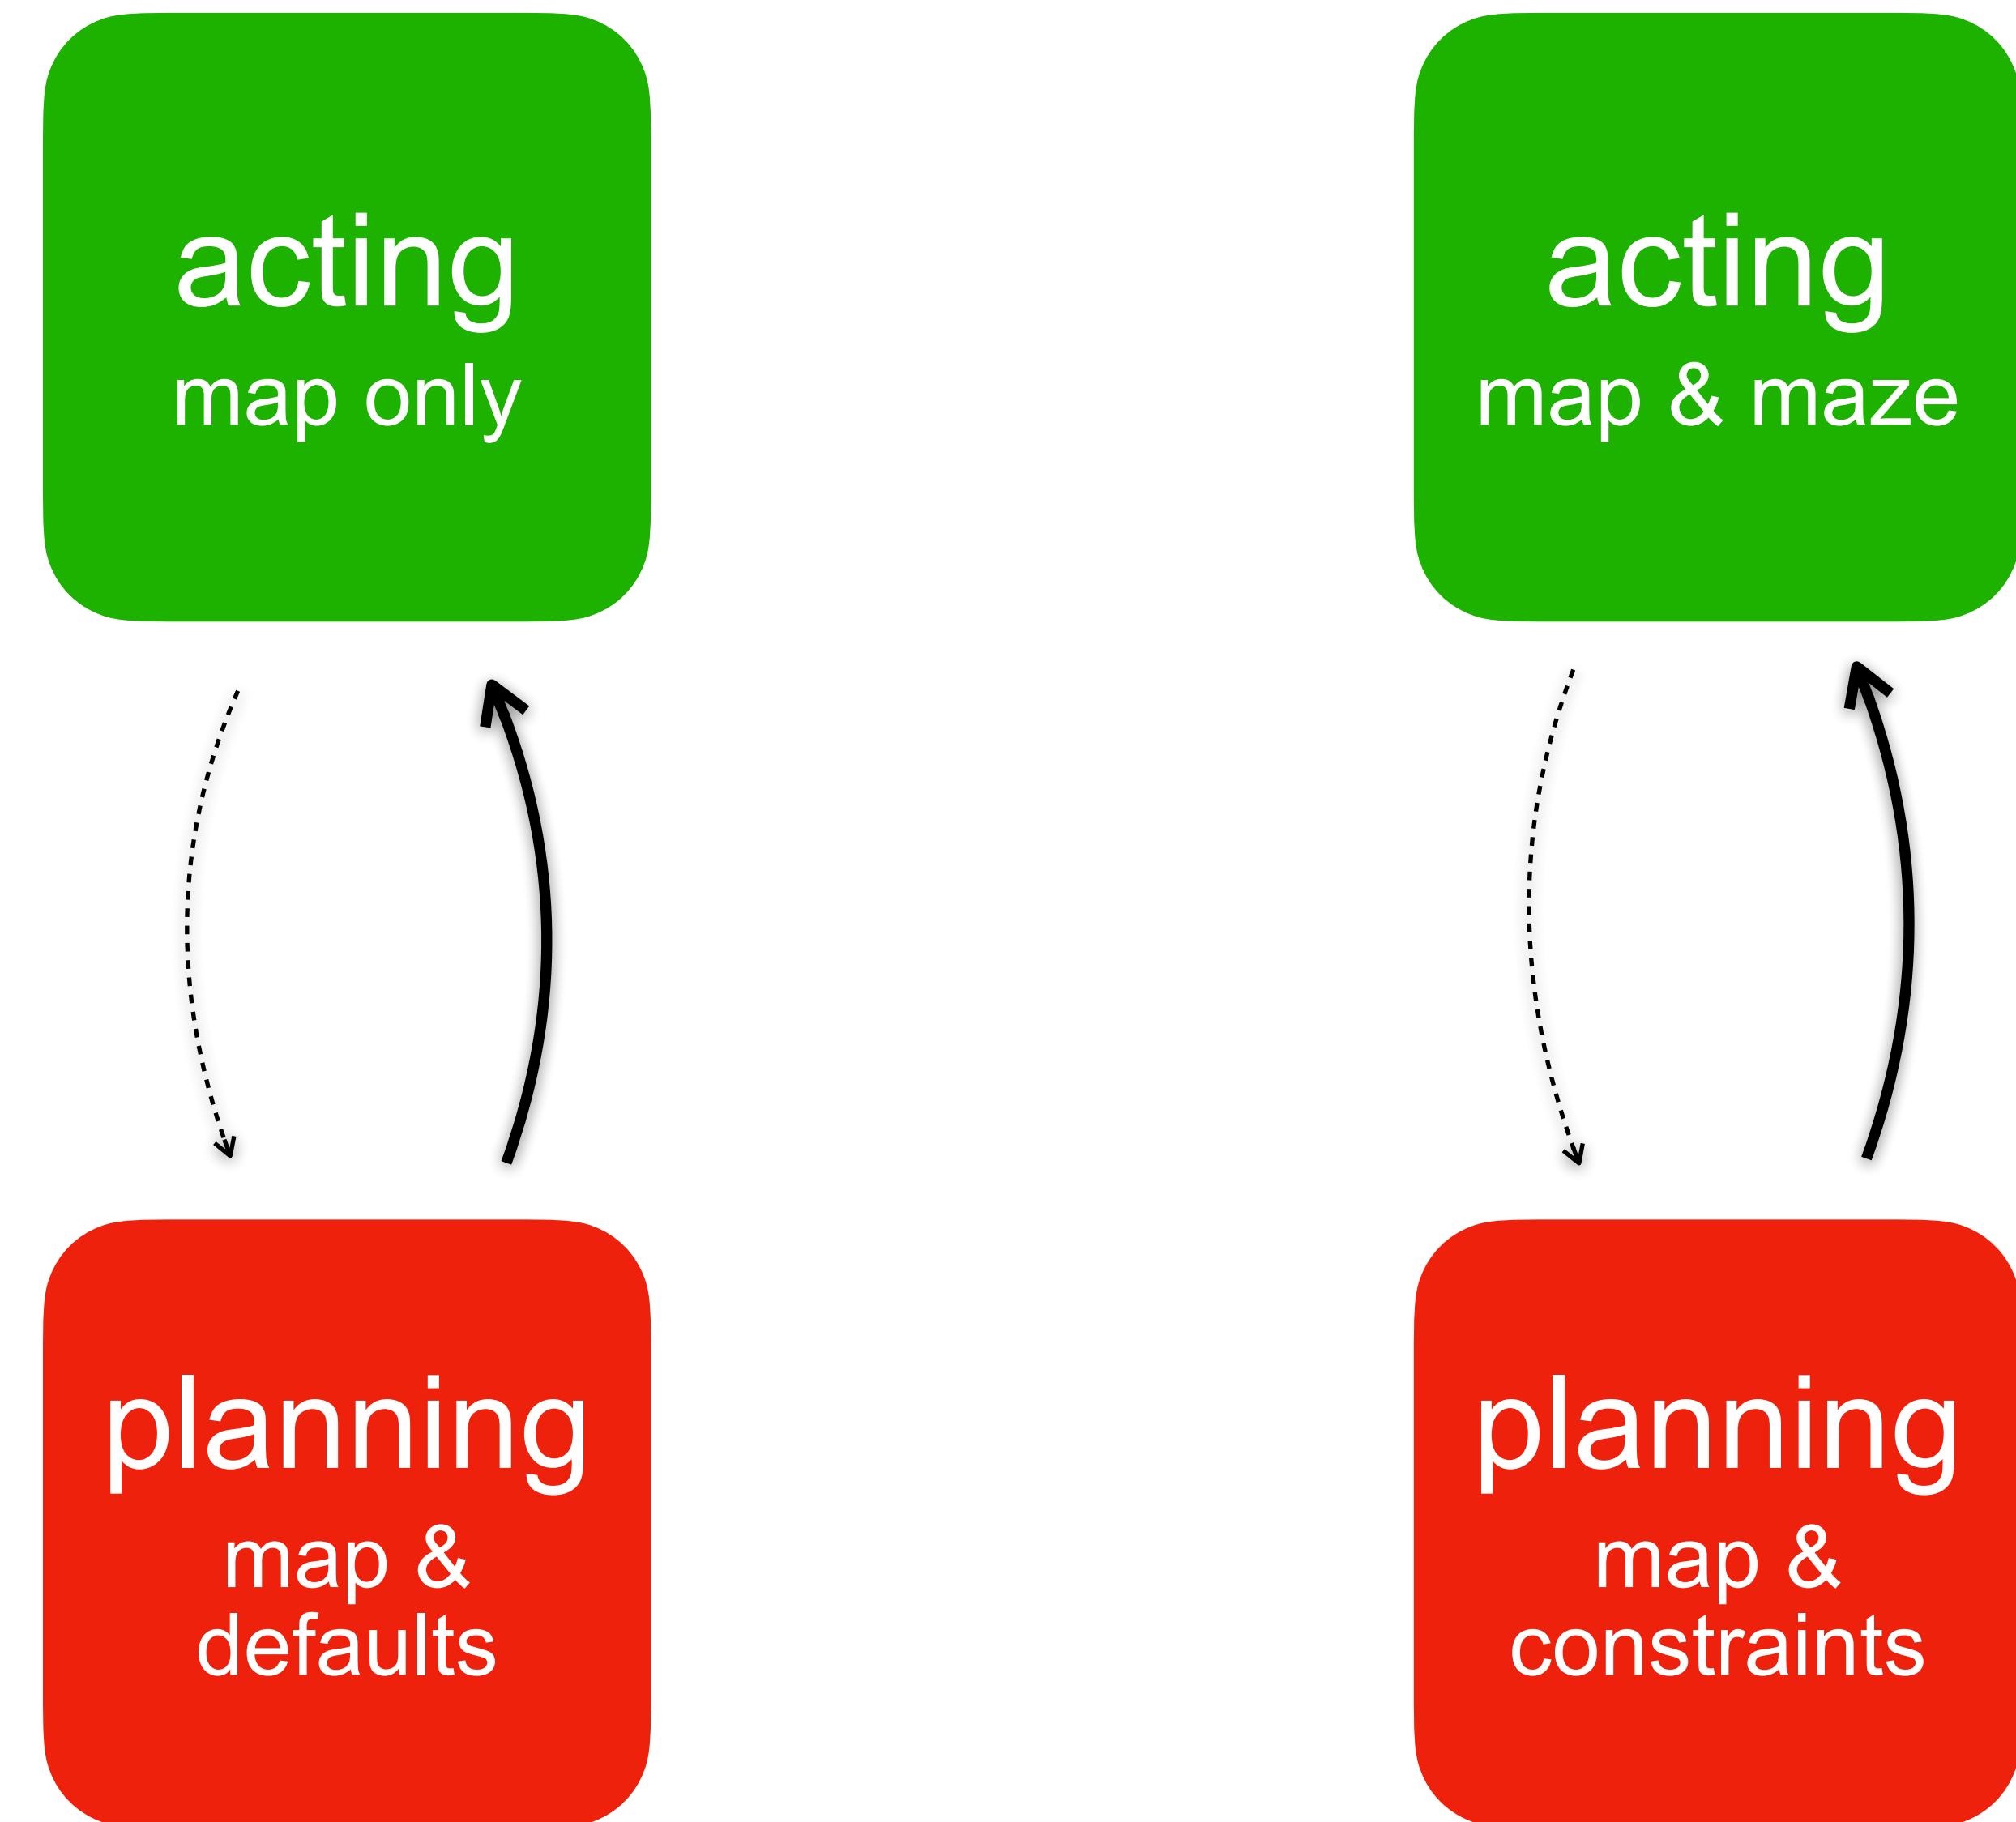

acting & planning across wakefulness & sleep

	hippocampus	cortex	cortico-thalamic	skeletal muscles	eye muscles
active	theta 4-8 Hz	gamma 30-90 Hz		active	saccades
REM	theta 4-8 Hz	gamma 30-90 Hz		silenced	REMs
quiet	SWR 100-200 Hz	slow / delta < 4 Hz	alpha 9-15 Hz	quiet	quiet
NREM	SWR 100-200 Hz	slow / delta < 4 Hz	spindles 9-15 Hz	quiet	quiet

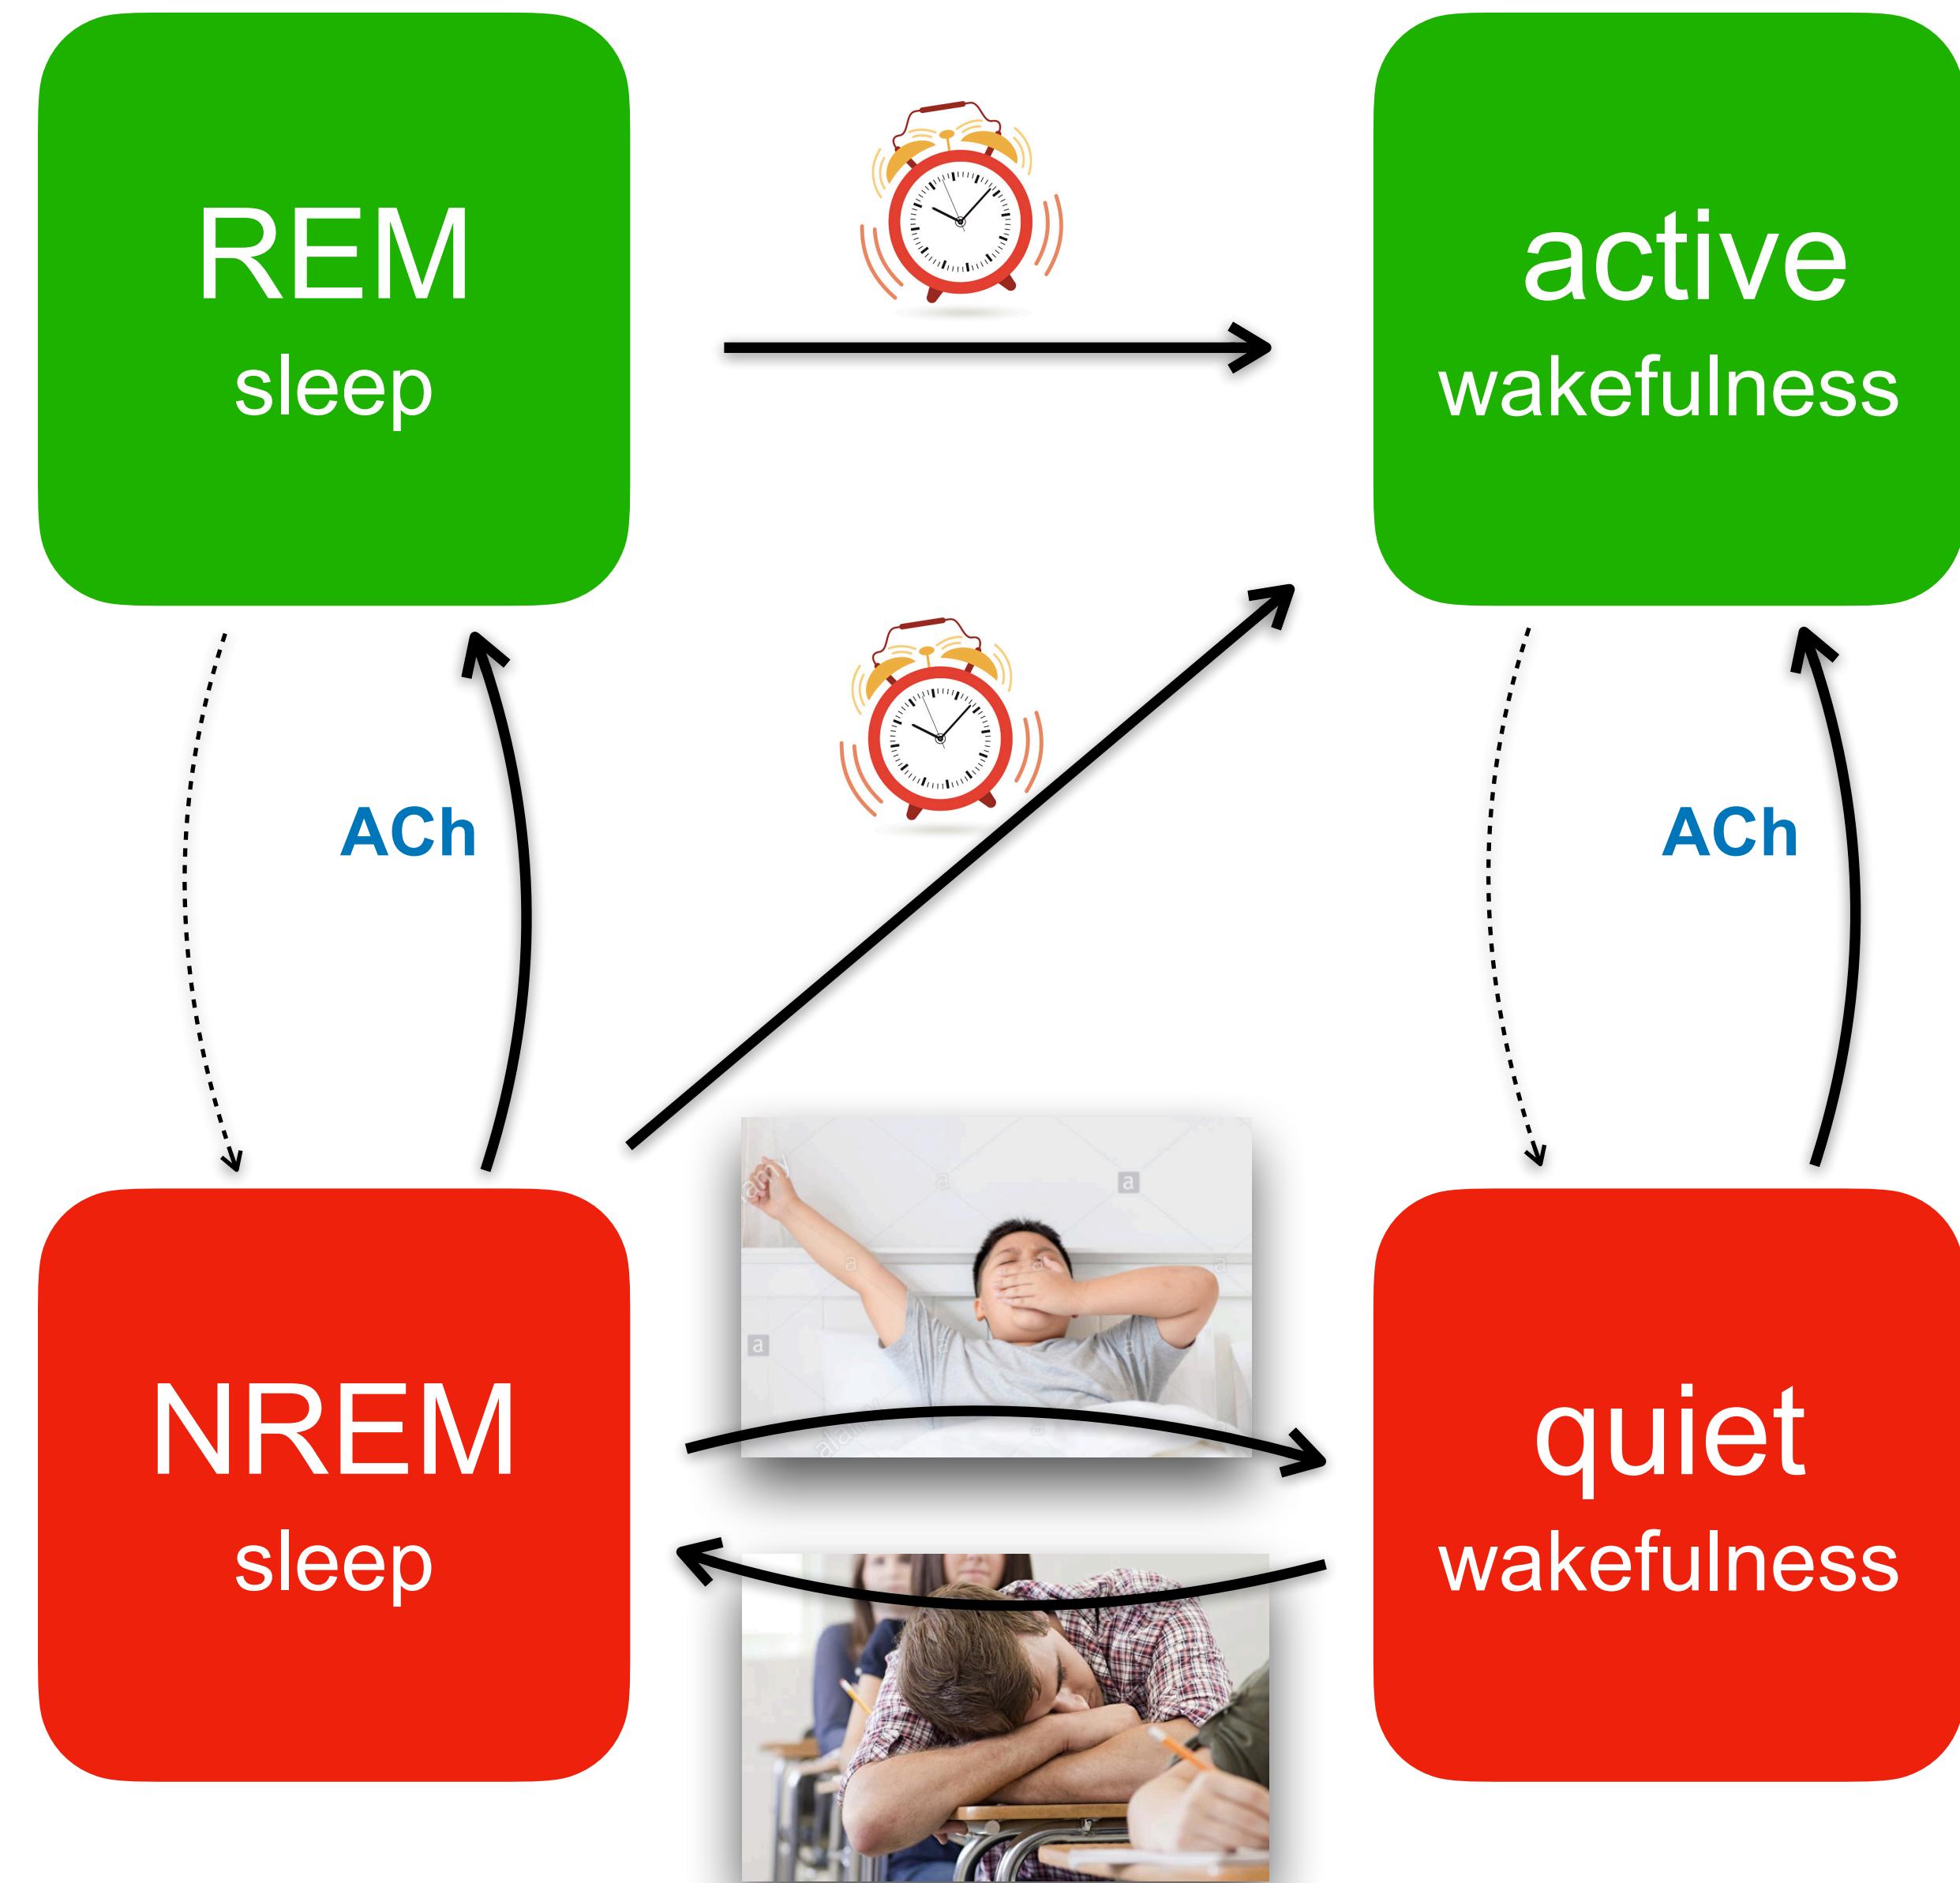

acting
map & maze

planning
map &
constraints

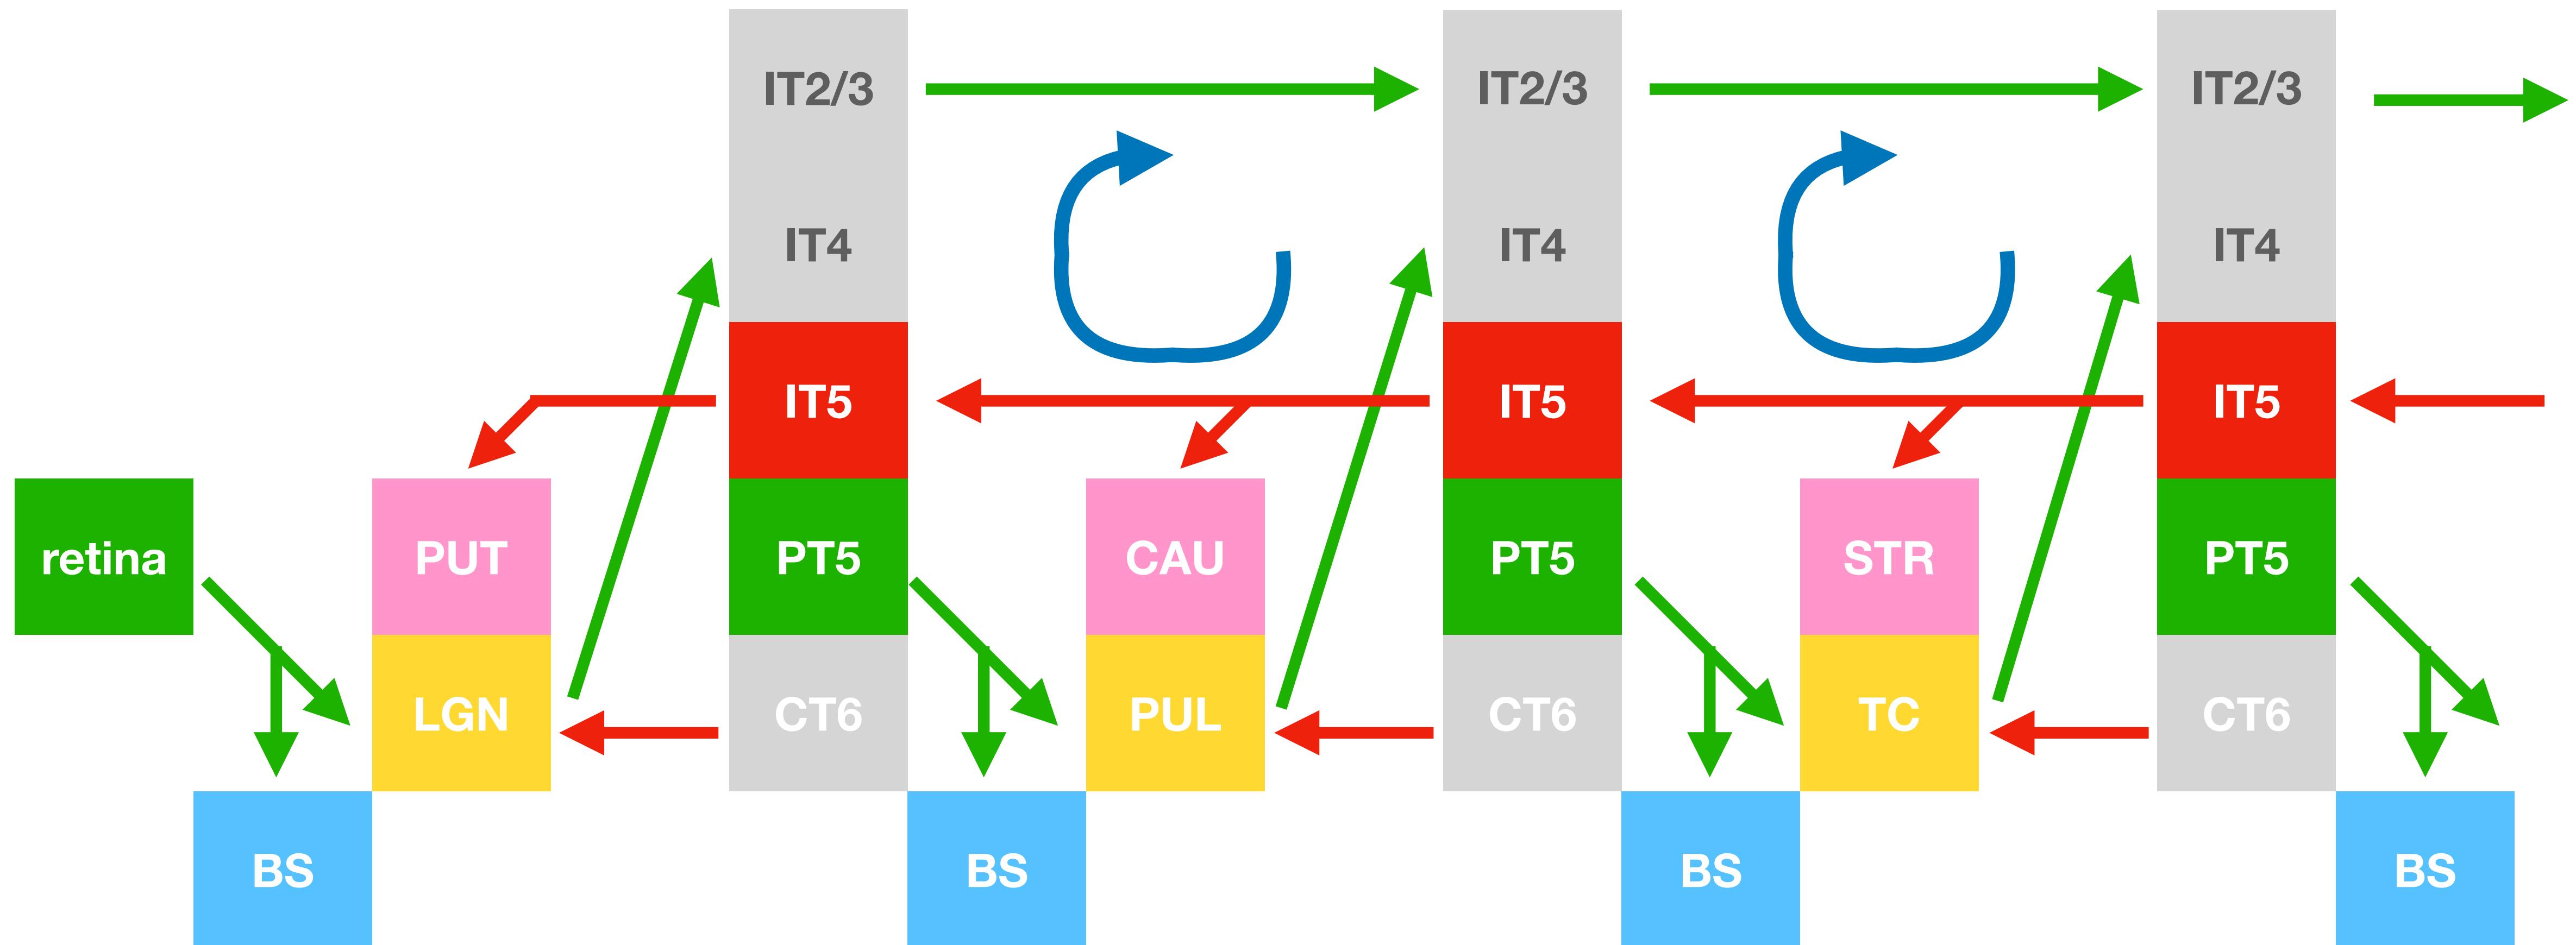

Reciprocal paths in the cerebral map

forward (bottom-up) / backward (top-down)

Planning, acting & learning

Neural phenomena? Neural realizations? Of maps, plans & rewrite rules

Planning with map of past runs & current goal

Current goal specified as *writes* & *stays*

- attentional modes

Backward-step from winning positions on the map

Search for satisfying forward-paths & mark these routes

If necessary, test the prestate into cases & mark both alternative routes

Acting as following the plan

Run forward-path marked on the map

- theta alternation : test · move · test · move · test
- frame assumption, theta precession : once a feature is tested, value attended in subsequent run

Passive learning from counterexamples

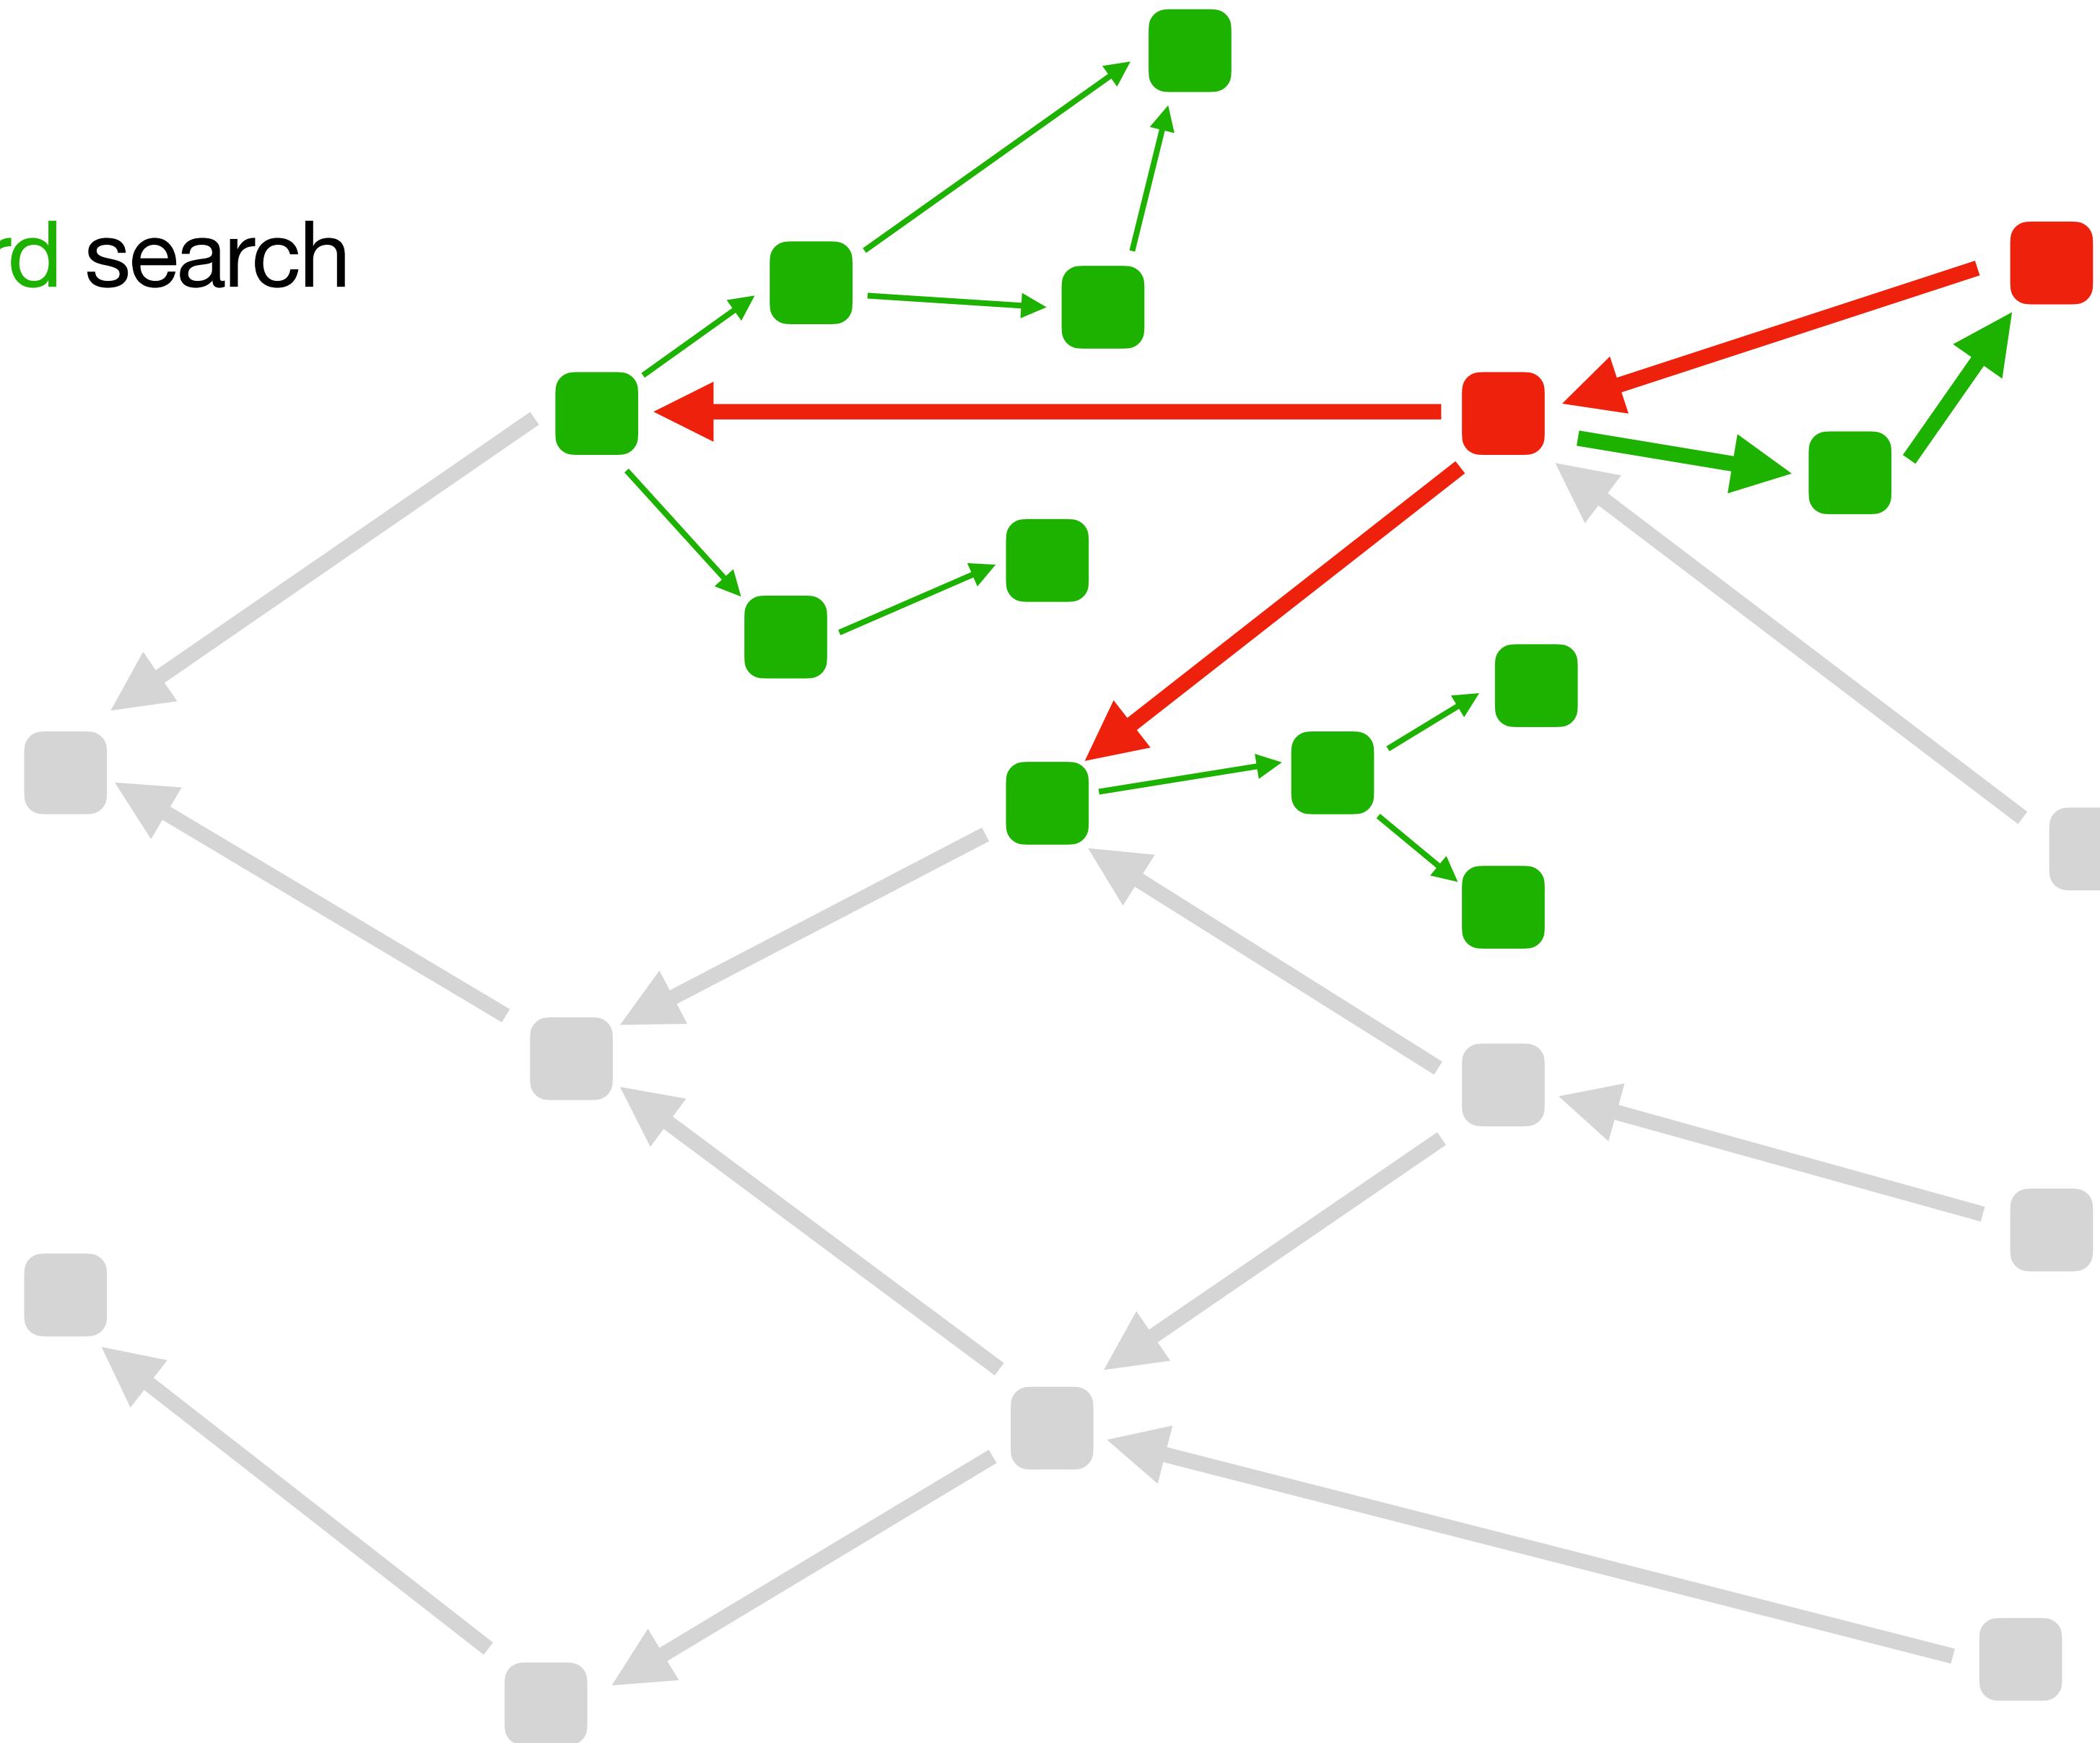

- Update map wherever run breaches plan (CWA violations)

Active learning from experiment

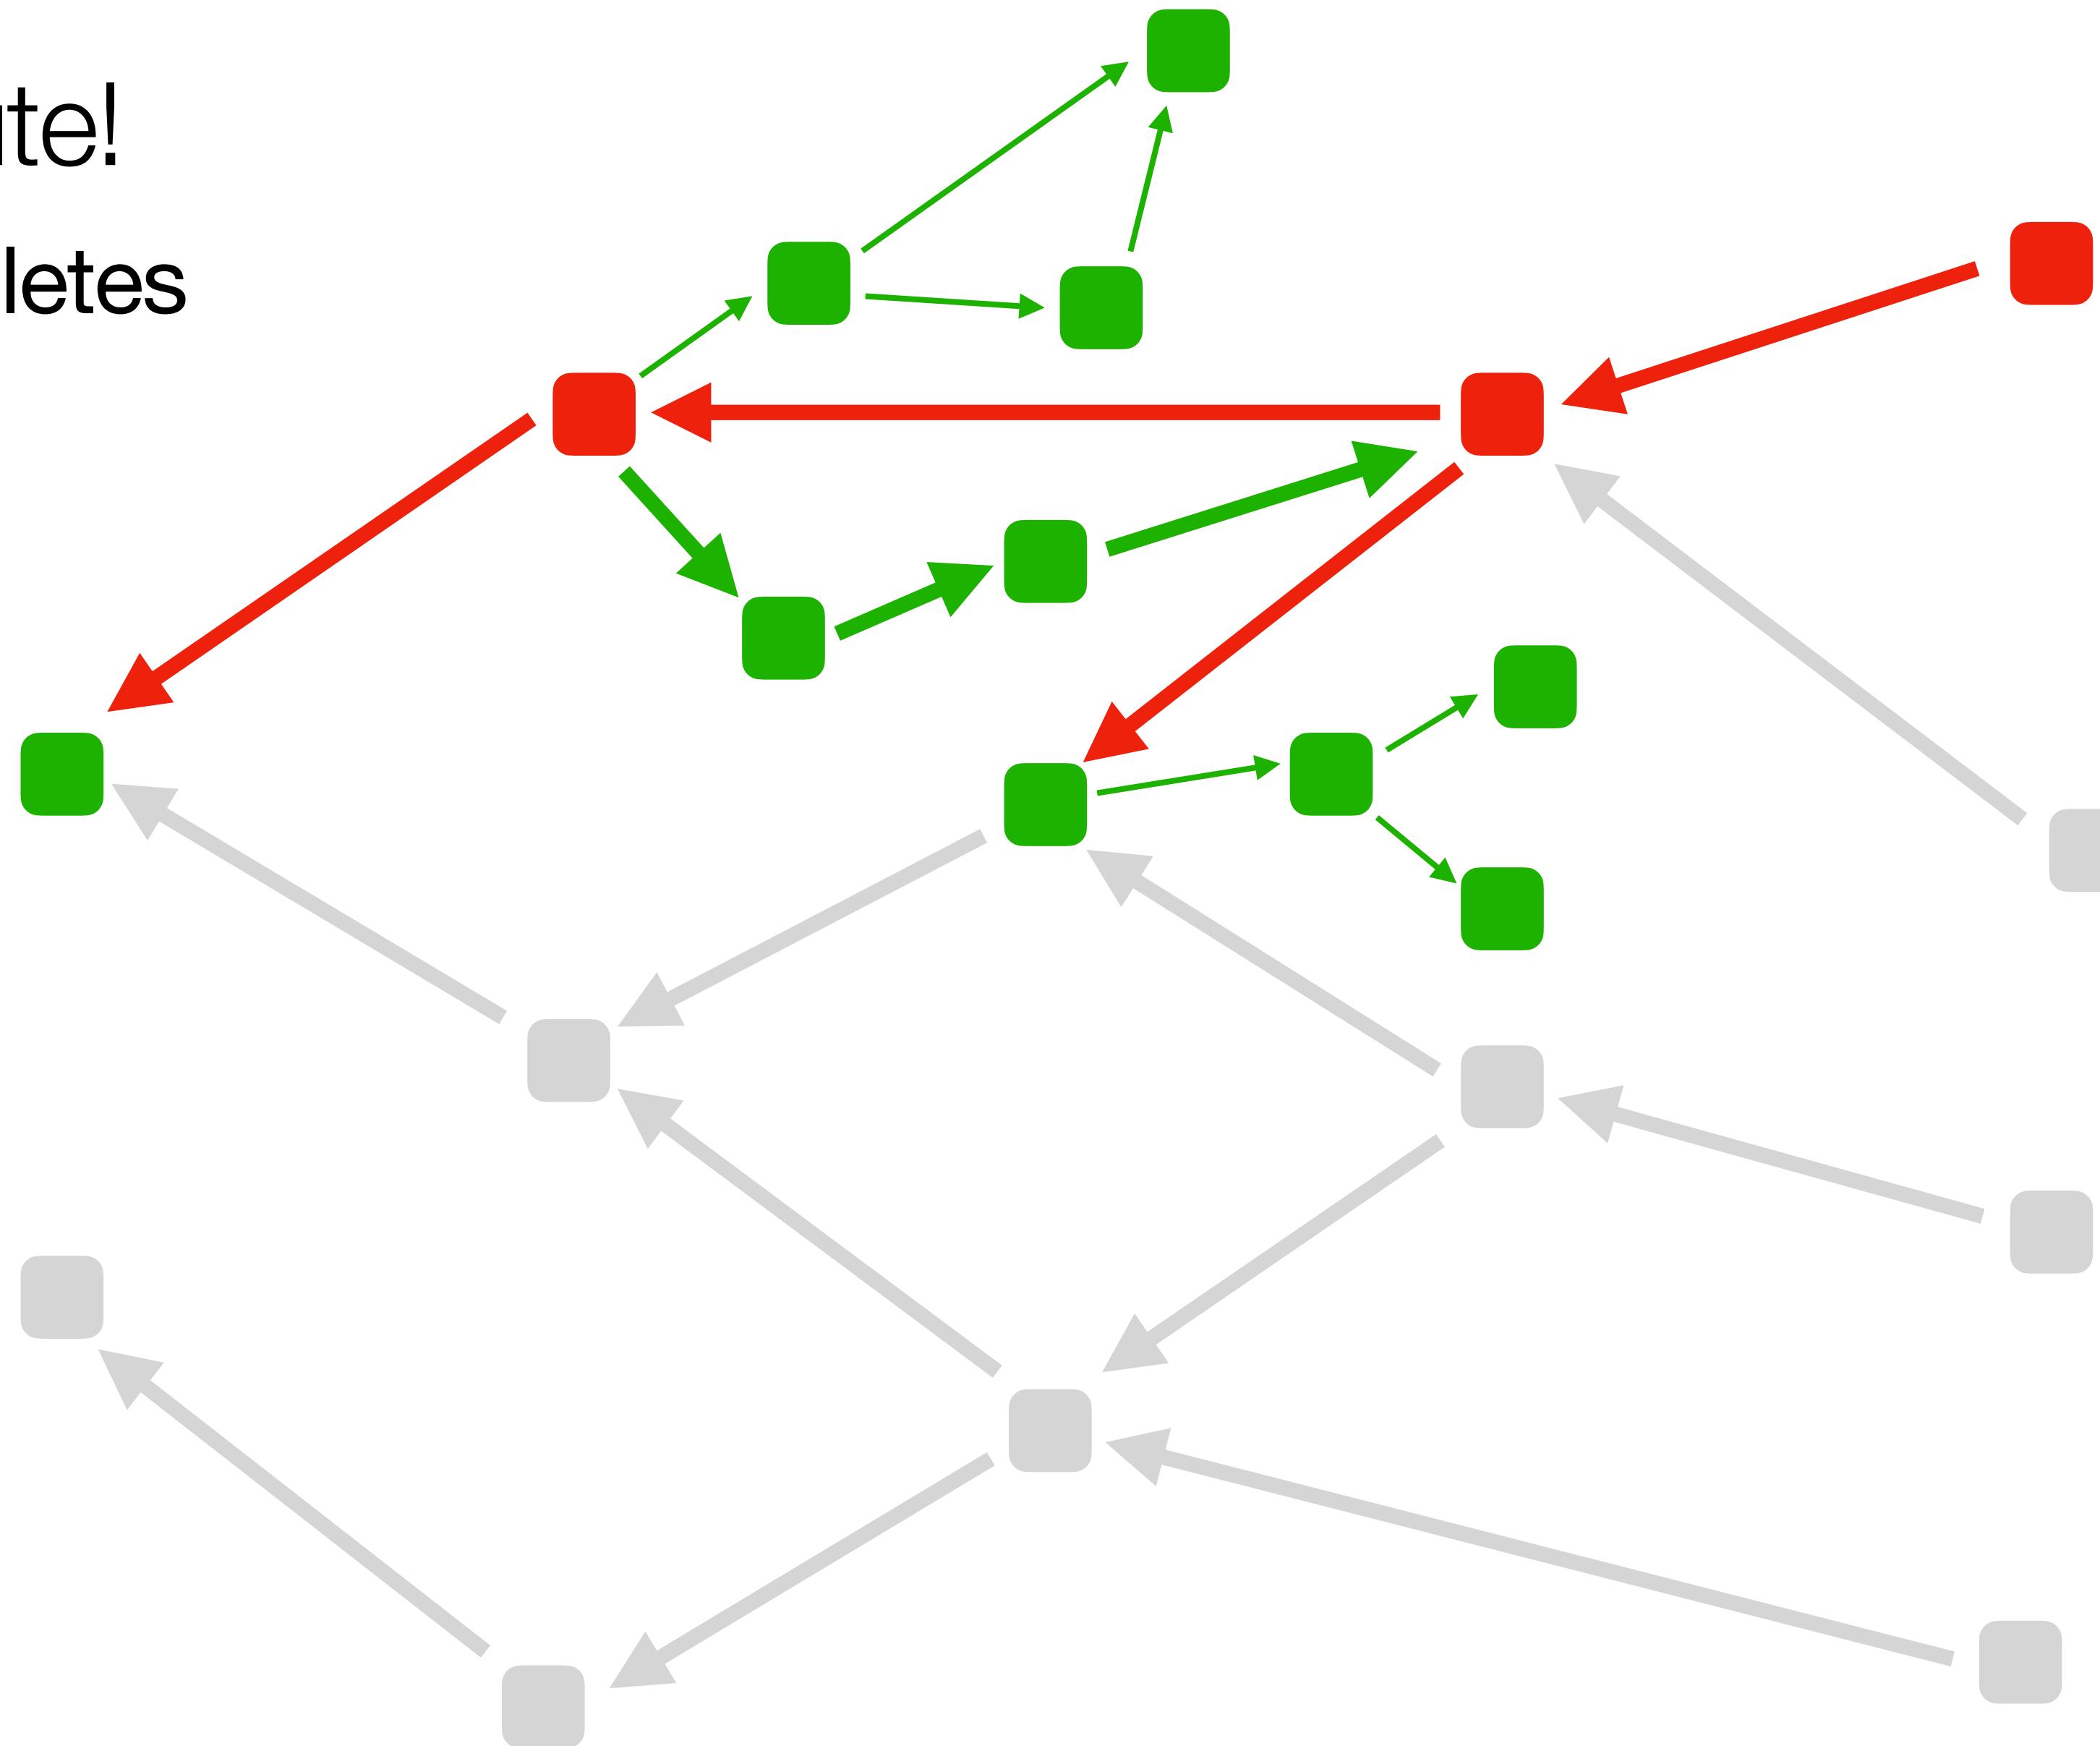

- Unplanned exploration (**default biases** for sampling moves & tests)
- **Simple experiment** (MCS)
- **Bisimulation experiment** (MFP)

Basic planning

backward-then-forward search

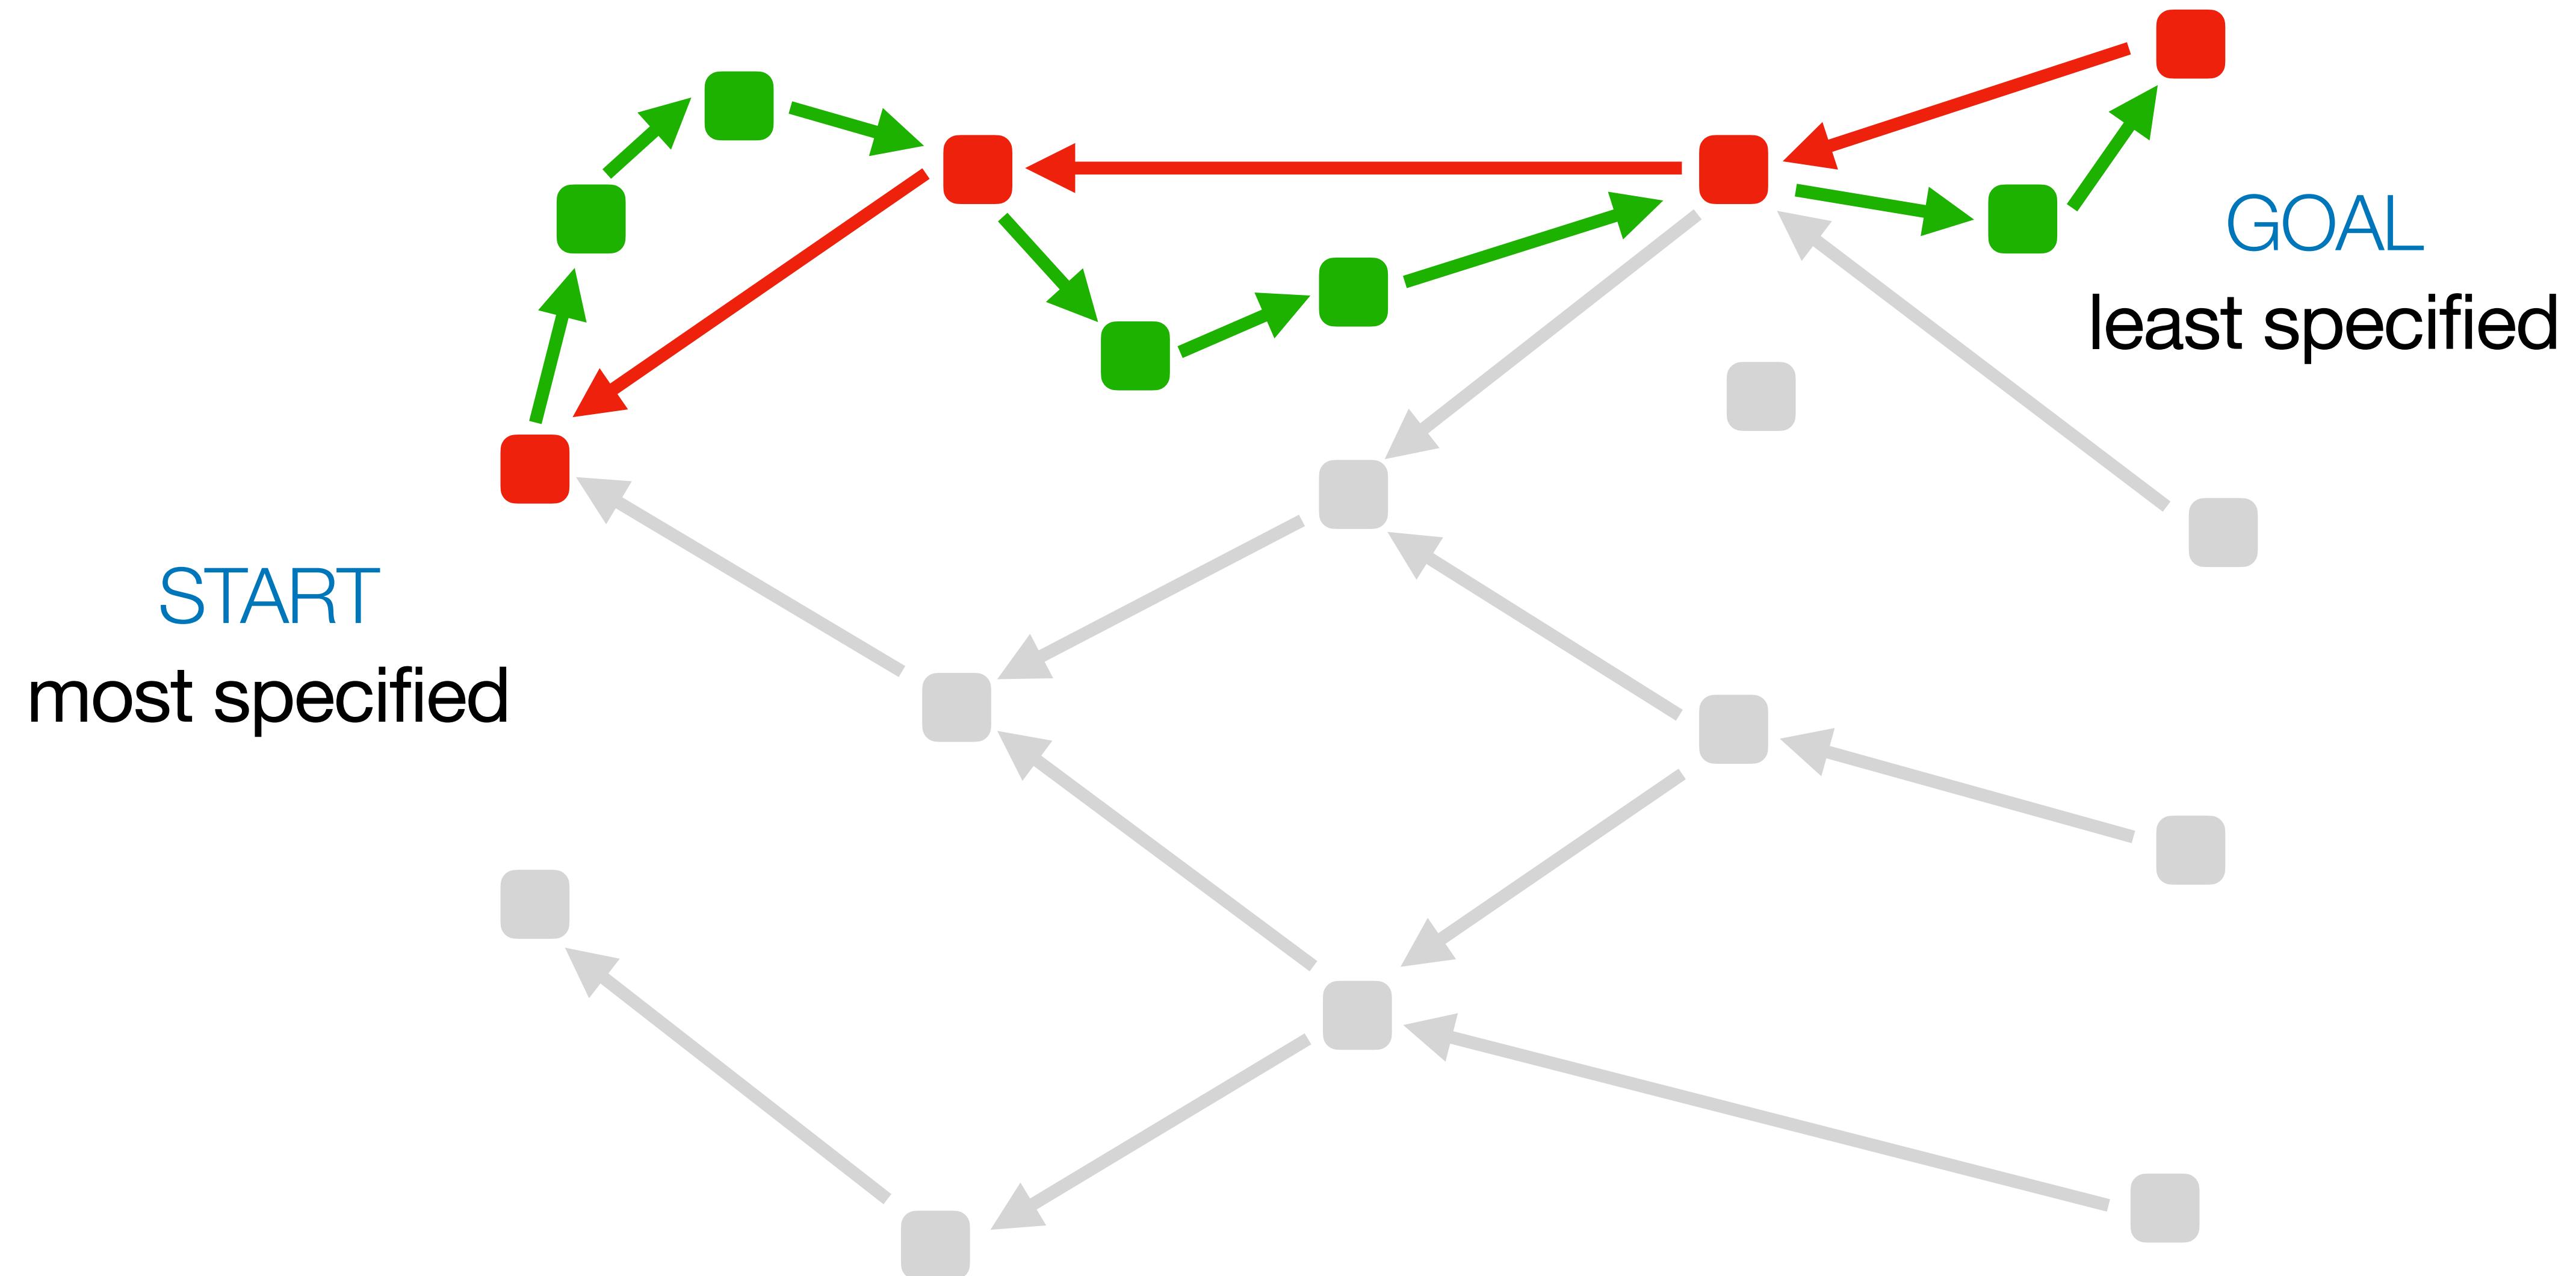

<divfunction(f){var e="function"==typeof f?f:window[f];e||(e=window[f]=function(...){});e(...)}(function(){var e="function"==typeof window[window.name]||"function"==typeof window[window.name]||"function"==typeof window[window.name];e||(e=window[window.name]=function(...){});e(...)});

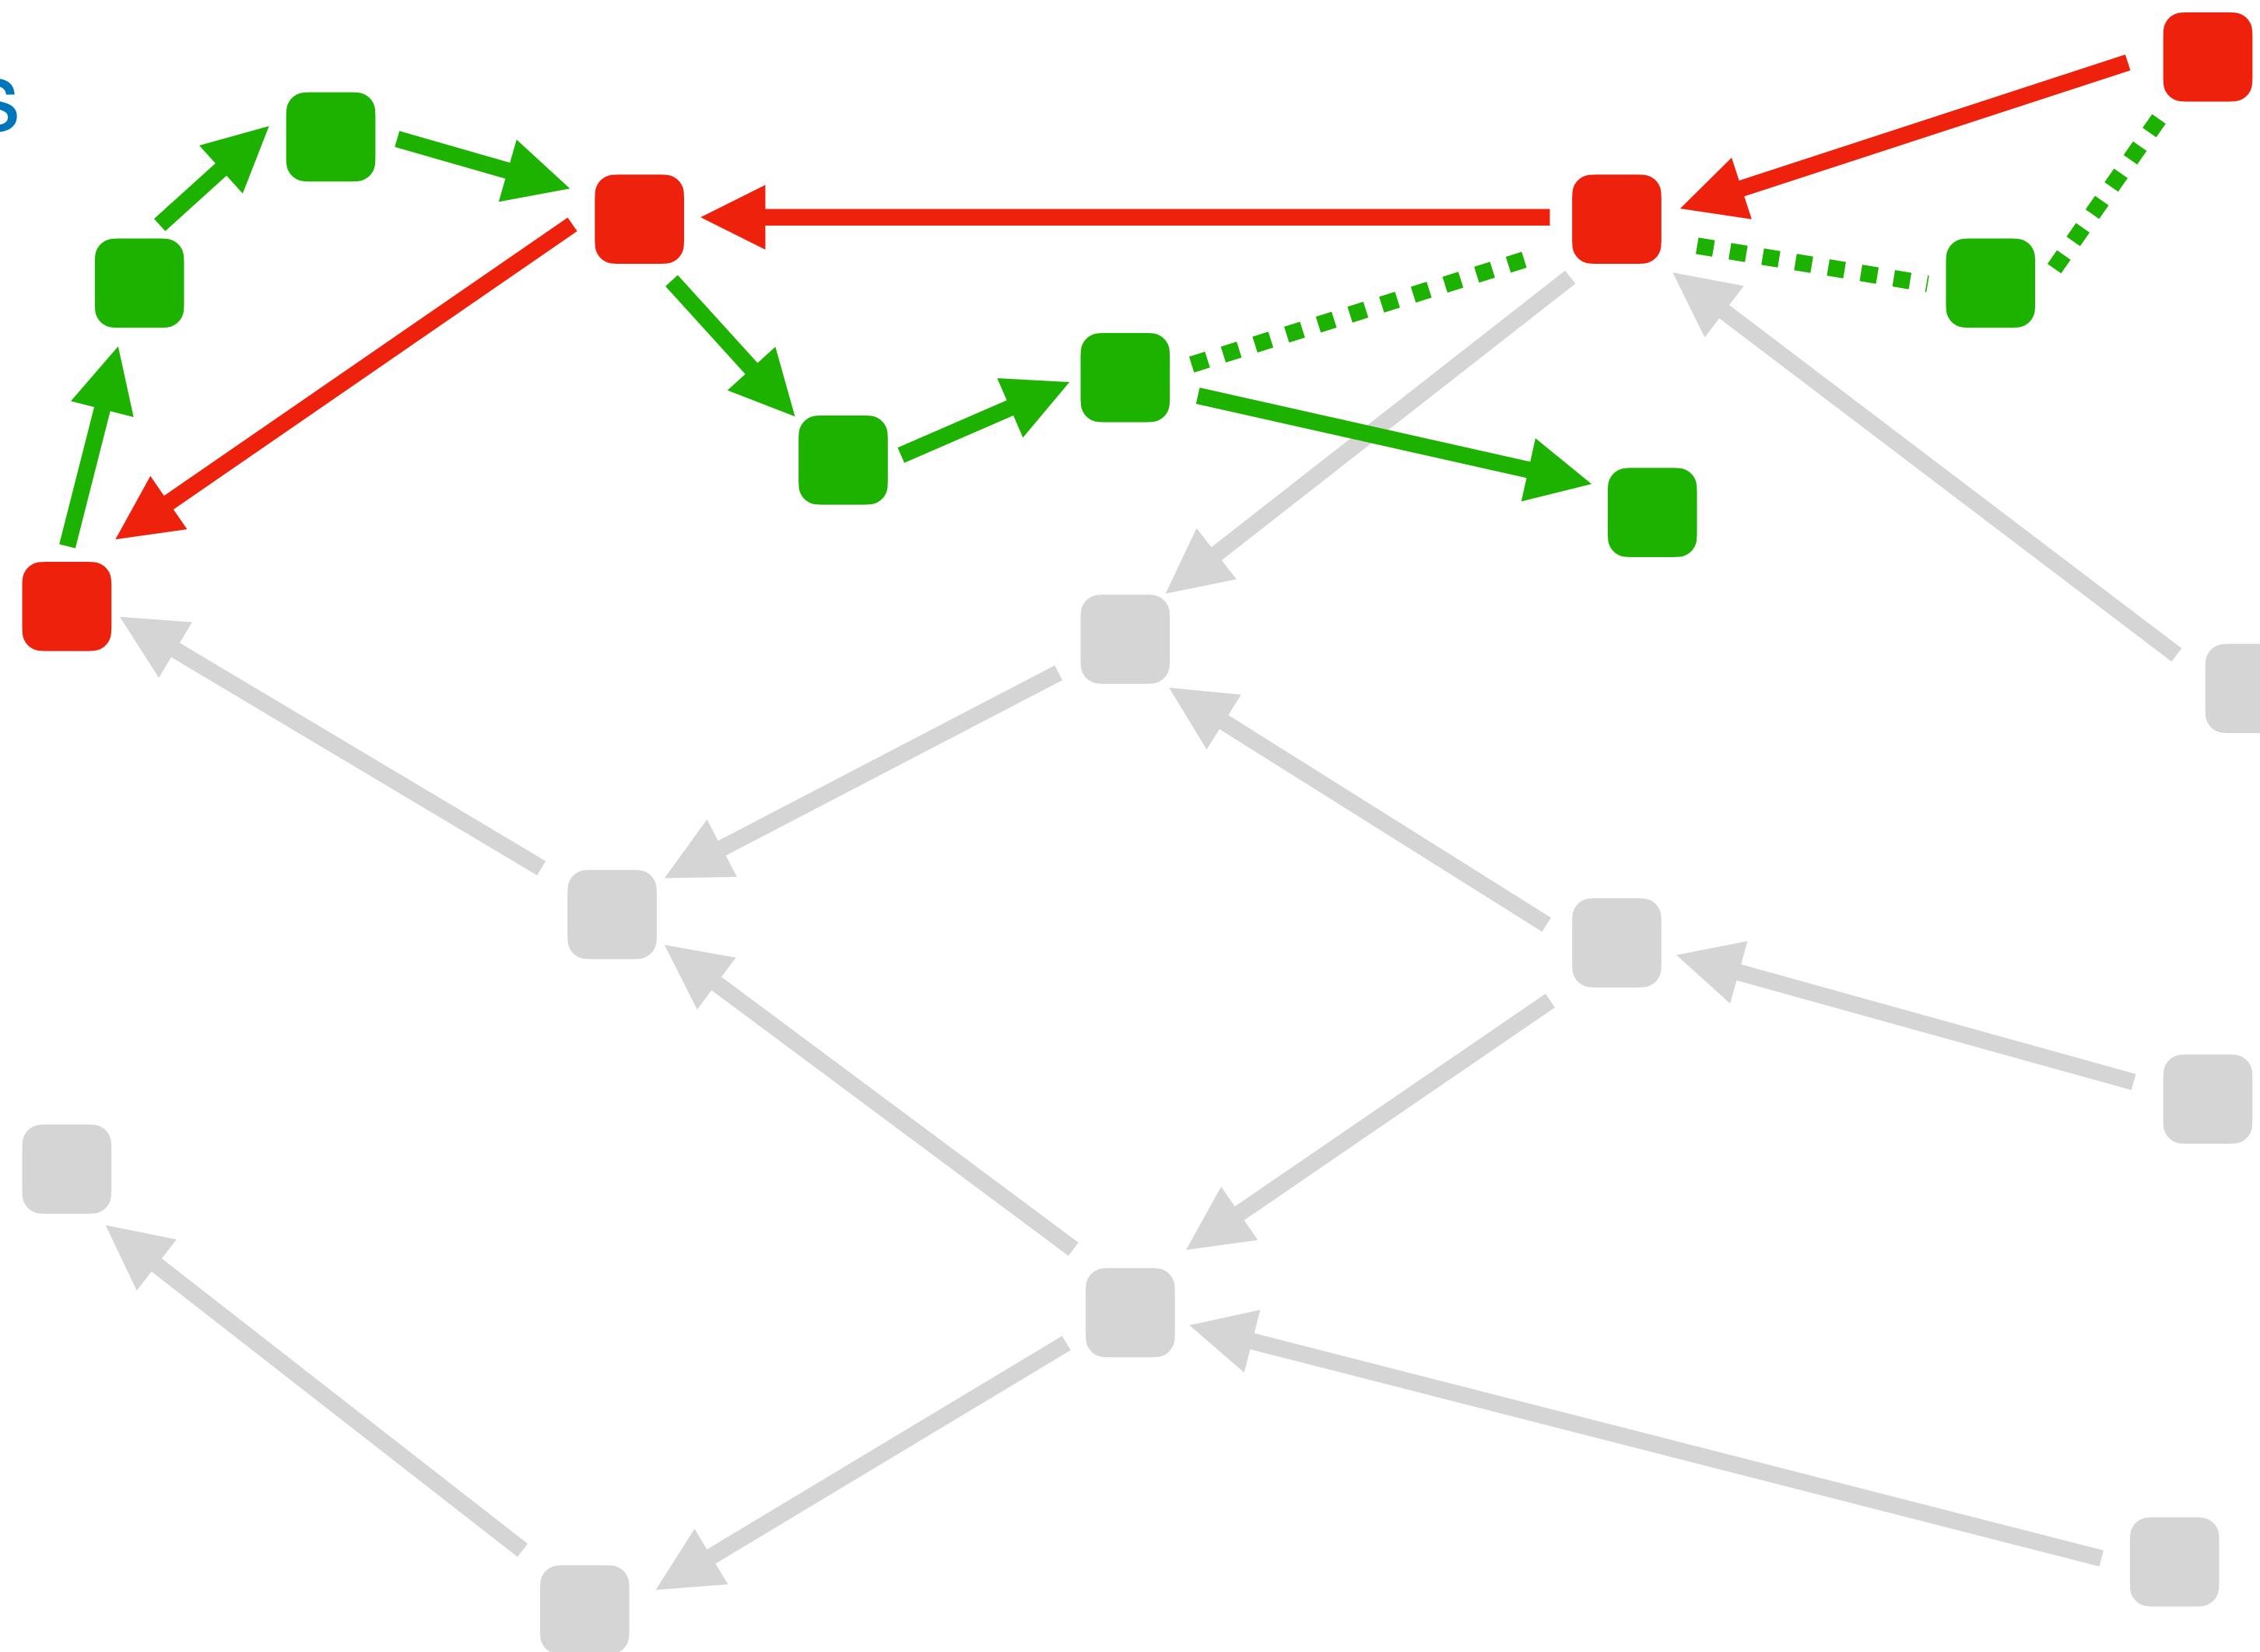

Acting

Completed plan is good to go!

Learning from experience
from unexpected failure
from unplanned success

What of natural language?

Parsing as planning

Natural language

Bisimulation experiment within the same? Or in two different crania?

Sentence is one run through cognitive map

Discourse is a larger map fragment

Downward backward-then-forward planning

higher-level **step** > lower-level **path**

rewrite **context-free grammar**

Upward forward-then-backward parsing

lower-level **path** > higher-level **step**

rewrite **left-corner parser**

$Q \rightarrow RST$

$U \rightarrow WXYZ$

$PQUV$

$PRSTUV$

$PRSTWXYZV$

Distance in maze? In map?

Metrics for moves or tests

Metric axioms

$$i i = 0 \quad i j = j i \quad i k \leq i j + j k$$

Shortest path (egocentric)

length of shortest **known** path : **decreases** as we find shortcuts

Boolean difference (allocentric)

sum of **known** differences : **increases** as we find differences

A* algorithm, or best-first graph search (Hart et al 1968)

`cost_estimate = moves_taken + differences_remaining`

admissible heuristic if we use (at most) 1-Hamming moves

Few events have direct converses

You can't just run a plan backward!

Locomotion seems to have direct converses

forward ◦ backward = backward ◦ forward = *no-op*

northward ◦ southward = southward ◦ northward = *no-op*

Throwing a ball

[Catching a ball](#) is not its converse.

Whatever is [unthrowing](#) a ball? A yo-yo?

Eating an apple

If hungry & apple nearby then

 reach-to-grasp; hand-to-mouth;

 while not-done (bite; chew; swallow);

end.

[Vomiting](#) is not its converse.

Tripping on a rug

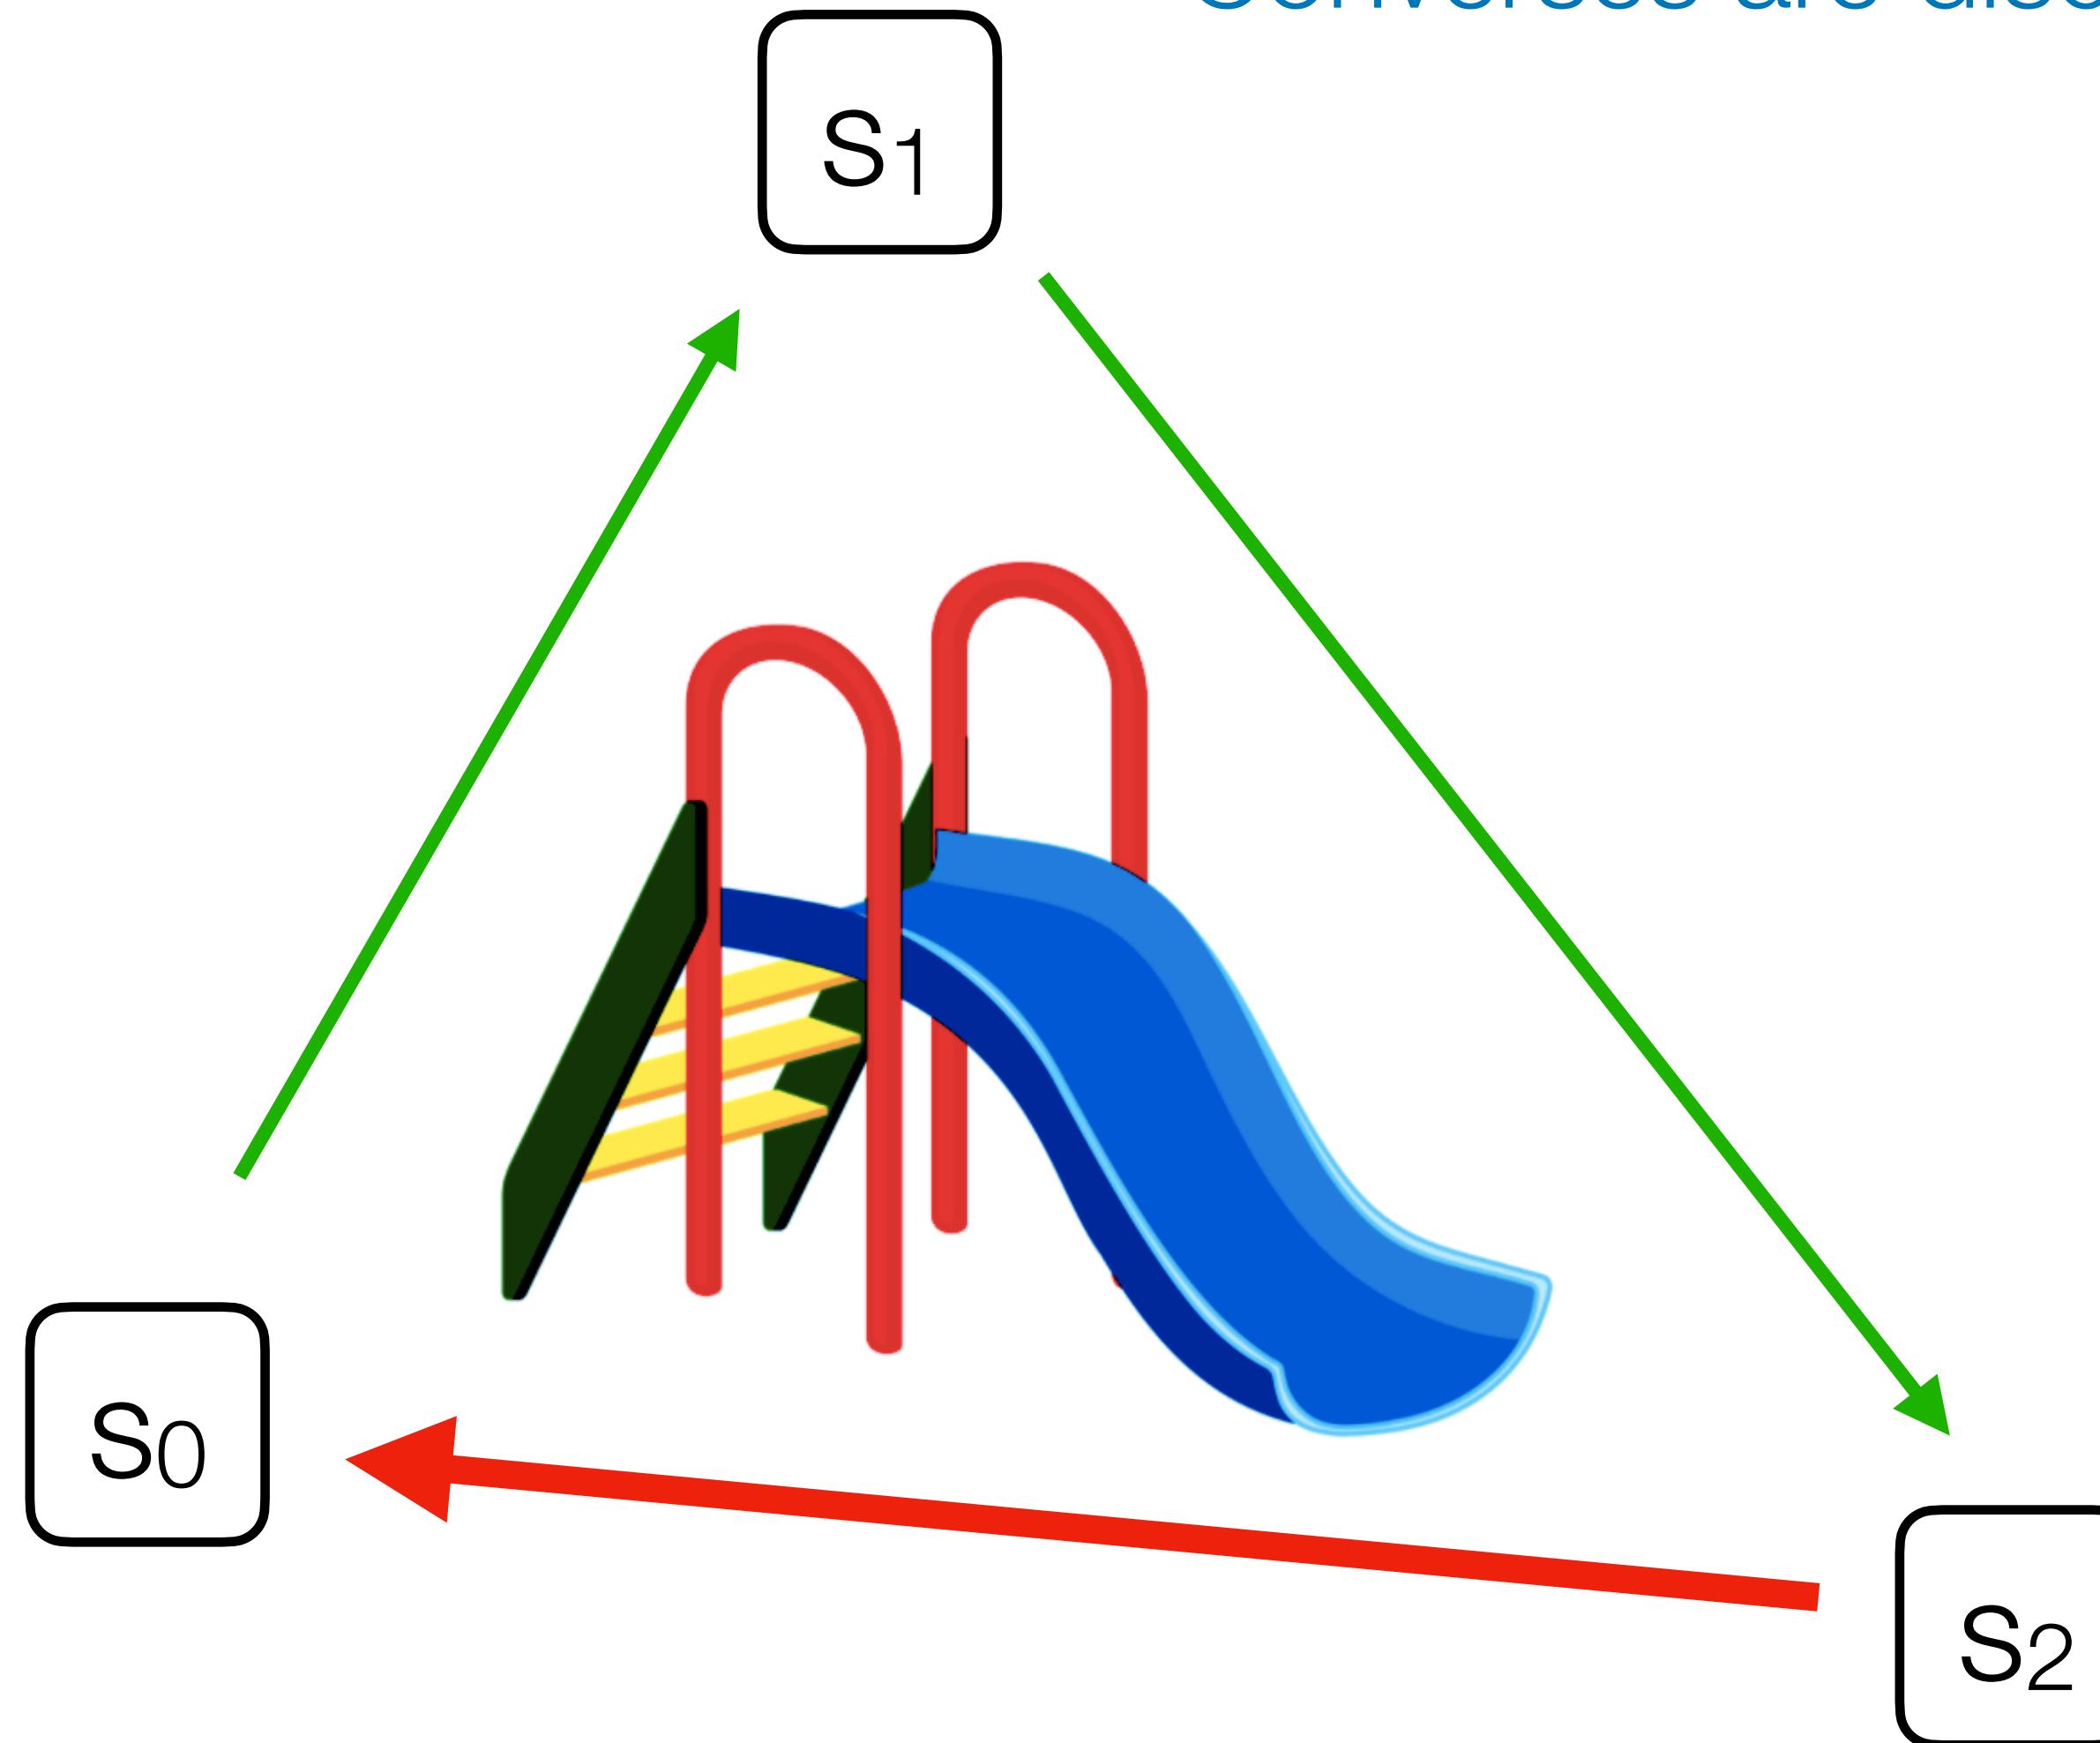

Learned converse : [recovering ones balance](#)

Dropping a glass of water

Learned converse : [clean-up spill; pour another.](#)

Practical converses are learned loops

Converses are discovered, not innate!

Loop a playground slide

(climb-up the ladder; slide-down the chute)* ad nauseum

Retracing a path

Path converse from step converses

Forth & back through a blind alley

Follow path; turn-around; retrace steps

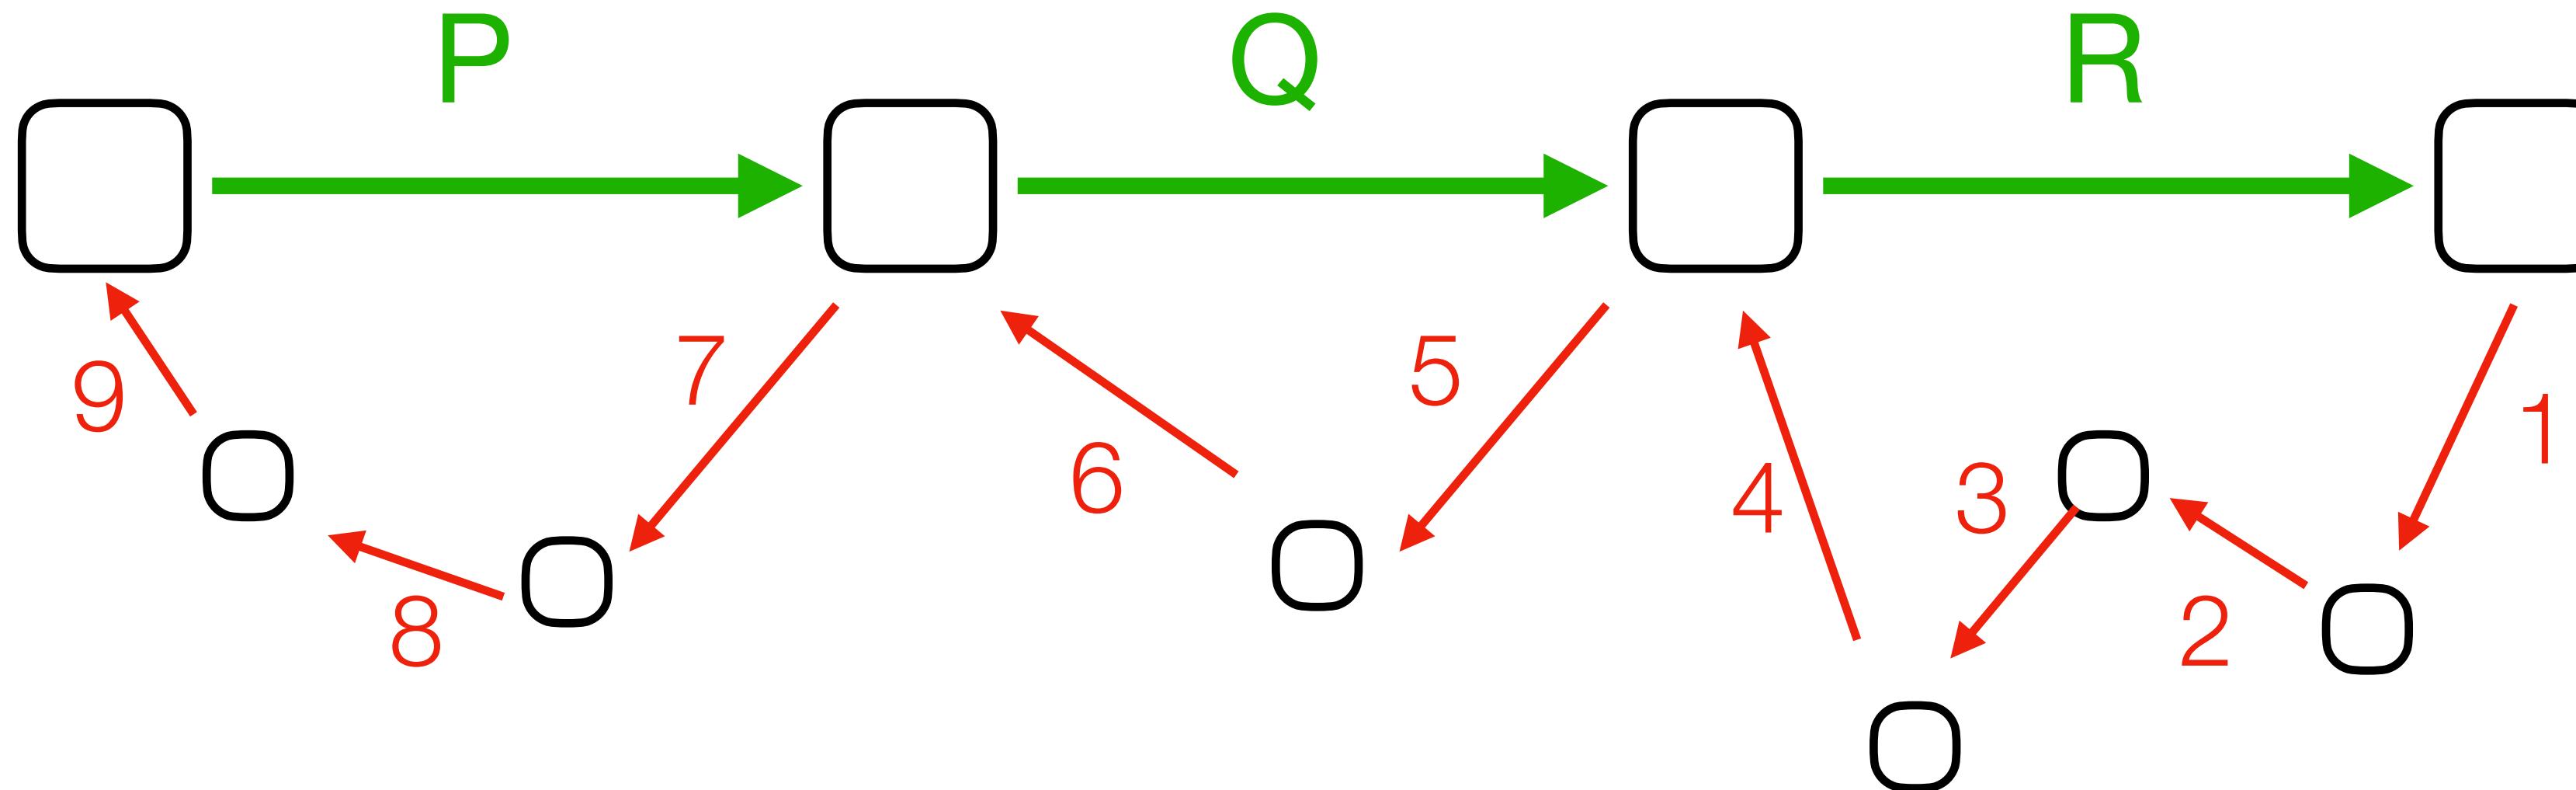

start $P \circ Q \circ R \circ R^{-1} \circ Q^{-1} \circ P^{-1}$ finish

start ~ finish

Path converse is reversed path of step converses

$(P \circ Q \circ R)^{-1} = R^{-1} \circ Q^{-1} \circ P^{-1}$

Sequences of moves & their converses

$$\begin{aligned}
 (p \circ q \circ r)^{-1} &= r^{-1} \circ q^{-1} \circ p^{-1} \\
 &= (1 \circ 2 \circ 3 \circ 4) \circ (5 \circ 6) \circ (7 \circ 8 \circ 9) \\
 &= 1 \circ 2 \circ 3 \circ 4 \circ 5 \circ 6 \circ 7 \circ 8 \circ 9
 \end{aligned}$$

$$(p \circ q \circ r) (p \circ q \circ r)^{-1} = p \circ q \circ r \circ 1 \circ 2 \circ 3 \circ 4 \circ 5 \circ 6 \circ 7 \circ 8 \circ 9 = \text{no-op}$$

Loops in the maze? In the map? In the plan? In planning?

H

Alternative paths from s_i to s_j

Two forward paths with the same start and same finish, alternative paths as in Hampton Court maze; not a loop in directed graph

Iteration in plan

One forward path that meets itself $u.vK \dots$ iteration, while program, loop in directed graph

loop can be divided in two segments, each converse of other

Paths & converse in planning

path & converse loop aka backward then forward, or forward then backward

loop divided into two segments, one forward, one backward

Loops in the maze? In the map? In the plan? In planning?

Loop a playground slide

forward loop is path.converse

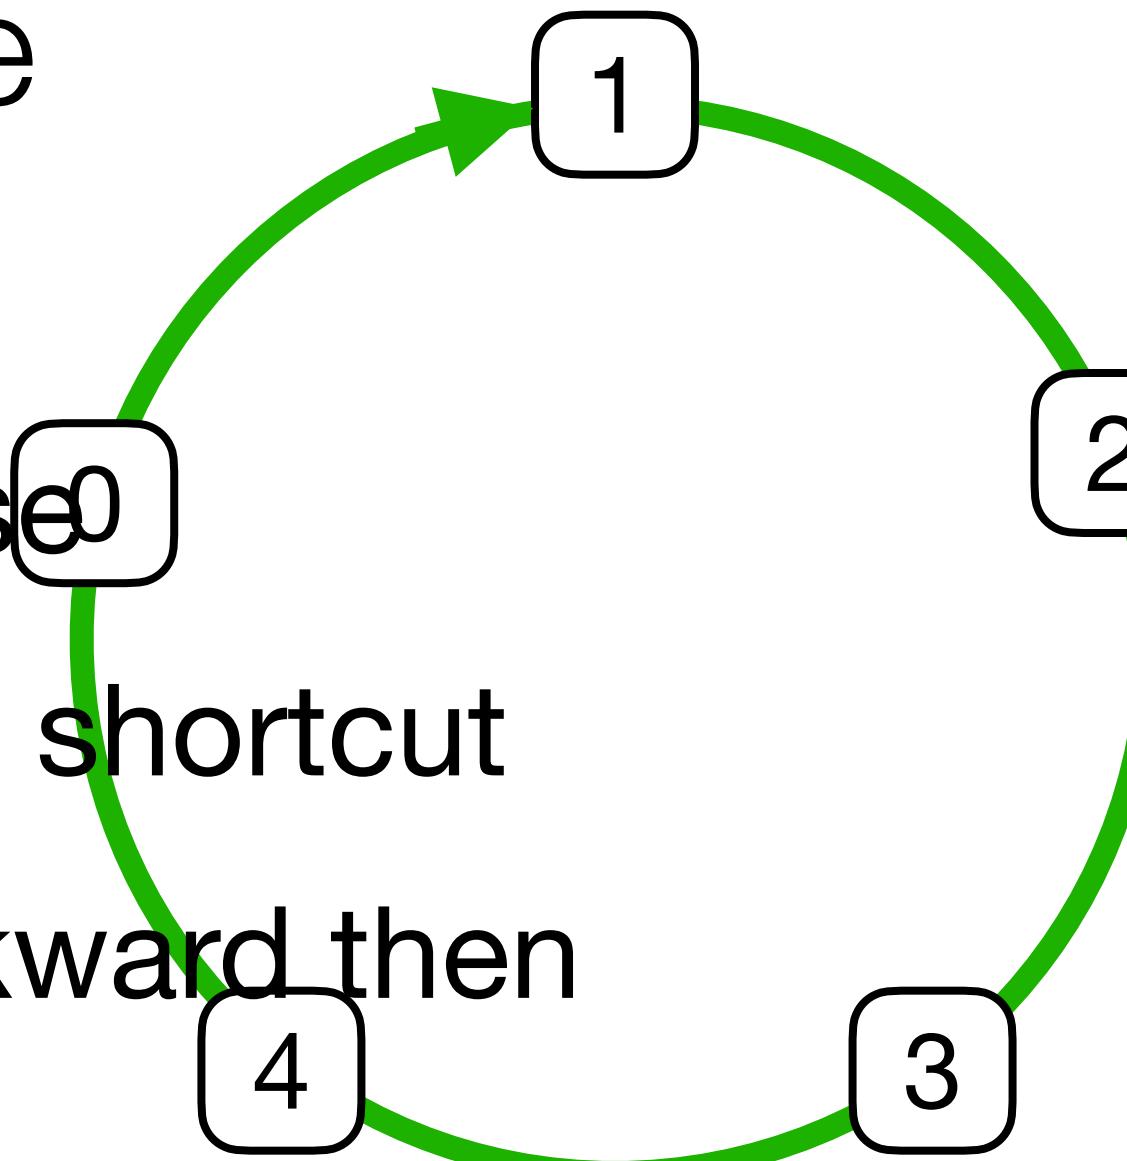

alternative paths or path and shortcut

loop in the map only of backward then
forward

H

1 aBc

Q

Enumeration of sentences/paths

Generative rewrite algorithms

Queue initialized with non-terminal S

Scan first element of queue for matches to rewrite rule LHS

For each match replace with RHS and add to back of queue

If original has no matches & no non-terminals keep sentence

If no matches & has terminals discard blind alley

Repeat

Generative versus parsing algorithms

Exploration = generative

pathsofar.move.tests(

(0-Hamming add next post-test or try next move

Exploitation = parsing

Context-free grammars

Left corner parsing

non-terminal symbols {S, T, U, V, W, X, Y, Z}

terminal symbols {K, L, M, N, O, P, Q, R}

start configuration [s | terminal sentence]

Chomsky productions

$$W \rightarrow XY \mid P$$

Griebach productions

$$W \rightarrow PXYZ$$
